IMPACT OF RESONANT LEADERSHIP ON EMPLOYEE POSITIVE AFFECTIVITY IN PRIVATE HOSPITALS IN SULAYMANIYAH CITY KURDISTAN REGION-IRAQ

May 2025

Abstract

The purpose of this study is to look at the effects of resonant leadership on employees' positive affectivity in private hospitals in Sulaymaniyah, Kurdistan Region of Iraq. Resonant leadership, defined by mindfulness, compassion, and emotional intelligence, is critical for shaping workplace dynamics and employee well-being

A quantitative research design was used, with data collected via a standardized questionnaire issued to personnel at chosen private hospitals. The study investigates the relationship between the three characteristics of resonant leadership. The findings are meant to give useful information for hospital administrators and policymakers looking to establish a supportive and emotionally healthy work environment.

This study adds to the expanding body of literature on leadership and emotional intelligence by applying it to the healthcare setting of the Kurdish region, providing practical ideas for improving employee morale and organizational commitment.

CHAPTER ONE

1 INTRODUCTION

1.1 Background

This research examines the impact of resonant leadership and positive affectivity on workplace outcomes, particularly within the healthcare sector. Resonant leadership, characterized by mindfulness, hope, and compassion, has been shown to enhance organizational commitment. Similarly, positive affectivity influences job performance and overall workplace well-being. By analyzing empirical studies on these topics, this research aims to contribute to the existing literature and provide insights that can be applied to private hospitals in Sulaymaniyah, Kurdistan. The study will assess the extent to which resonant leadership and positive affectivity influence commitment, offering valuable recommendations for leadership development in the healthcare industry (Abesy, Ghandehari, & Alvedari, 2020).

1.2 Problem Statement

Problems including low employee morale, burnout, and unhappiness are growing prevalent in Sulaymaniyah's private hospitals. The absence of emotionally aware leadership may be the cause of these difficulties. Although resonant leadership has been shown to enhance workplace well-being, little study has been done on how it directly affects workers' positive affectivity in the particular hospital setting.

1.3 Research objectives

- Examine the correlation between resonant leadership and positive affectivity.
- Assess the role of leadership effectiveness, particularly within the healthcare sector.

1.4 Scope of study

The aim of this study is to determine the correlation between resonant leadership and positive affectivity, assess the extent to which these variables exist within organizational settings, and analyze their impact on workplace outcomes. Specifically, this research seeks to explore how resonant leadership influences employees' wellbeing and how positive affectivity contributes to employee engagement, productivity, and organizational commitments.

1.5 Framework/ study model of research

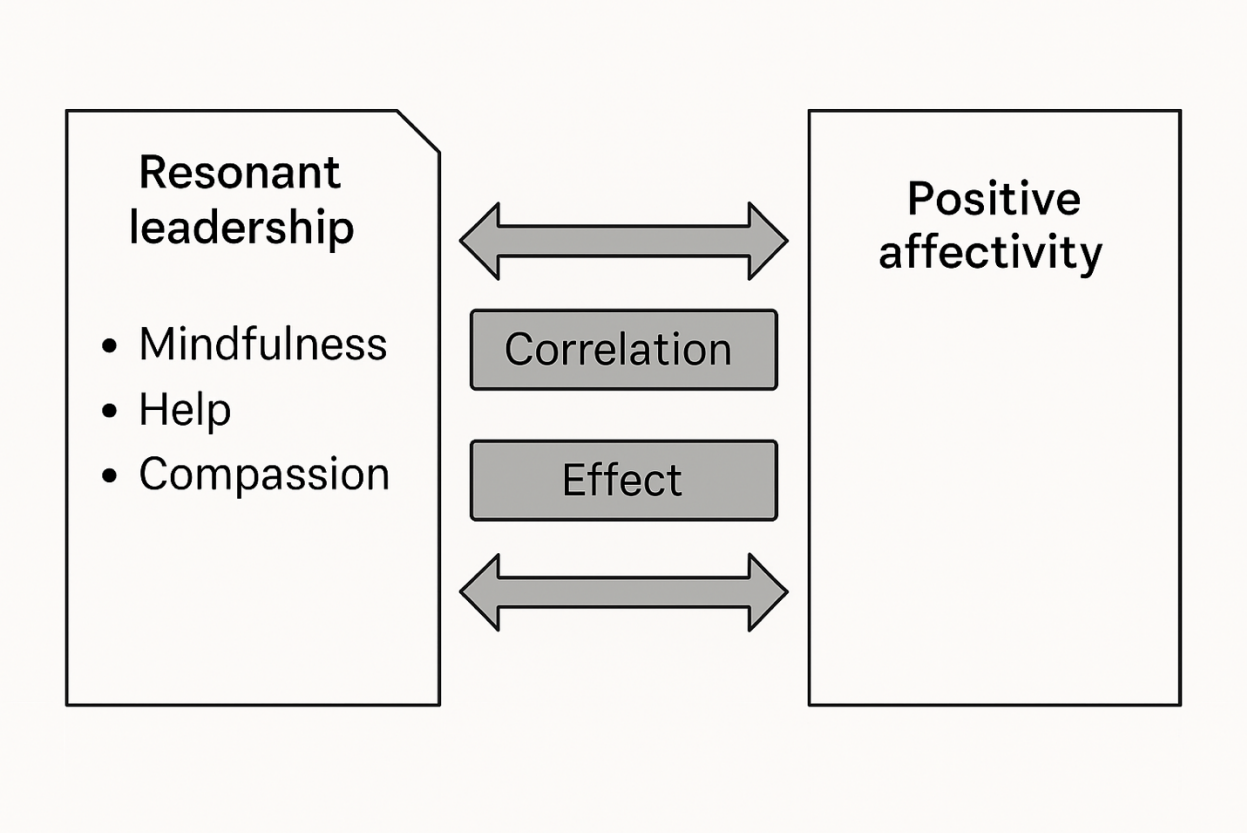

Figure 1 frame work of the study

1.6 Hypothesis

H1: Positive affectivity among staff members in private hospitals is positively correlated with resonant leadership.

H2 : R.L has a Positive significant effect on positive Affectivity

CHAPTER TWO

2 LITERATURE REVIEW

This literature review analyzes the impact of resonant leadership on employees' positive affectivity. Intelligence and compassion form the basis of resonant leadership, which enhances trust and collaboration. The ability to experience positive emotions is referred to as positive affectivity and it contributes to resilience, satisfaction, and performance. cumulatively, these factors enhance engagement and result in healthier workplaces. The review also analyzes some of the core attributes of leaders such as being mindful, helpful, and compassionate and the challenges that come with leadership.

2.1 Resonant leadership

The basis of resonant leadership is emotional intelligence and the capacity to build solid, compassionate bonds between team members and leaders. It seeks to establish a constructive and emotionally secure workplace where staff members feel valued, involved, and motivated to give their best efforts. Self-awareness, mindfulness, and emotional control are valued in this leadership style because they enable leaders to react with compassion and clarity (Abesy, Ghandehari, & Alvedari, 2020).

According to El-Sayed et al. (2022), following an educational intervention, nurse managers' resonant leadership behaviors considerably improved. Additionally, Tiwari and Lenka (2015) found that resonant leadership improved worker engagement, especially in businesses that were struggling financially. Similarly, Kosar et al. (2022) demonstrated that by encouraging empathy and emotional support, resonant leadership contributed to a decrease in workplace bullying in the Kurdistan area.

Resonant leadership encourages teamwork, innovation, and a common goal by emphasizing emotional connection and trust. In addition to improving team performance, it helps leaders avoid burnout and preserve emotional equilibrium. Because it promotes adaptability, candid communication, and long-term organizational growth, this leadership style works particularly well during times of transition or uncertainty.

2.2 Benefits of resonant leadership

This literature review analyzes the impact of resonant leadership on employees' positive affectivity. Intelligence and compassion form the basis of resonant leadership, which enhances trust and collaboration. The ability to experience positive emotions is referred to as positive affectivity and it contributes to resilience, satisfaction, and performance. cumulatively, these factors enhance engagement and result in healthier workplaces. The review also analyzes some of the core attributes of leaders such as being mindful, helpful, and compassionate and the challenges that come with leadership. Resonant leadership is emotionally aware and emphasizes the leader's ability to build deep, empathic relationships with staff. Resonant leaders build emotionally healthy cultures in which staff feel valued, engaged, and motivated. Through fostering trust, empathy, and open communication, resonant leaders build cooperation, resilience, and shared purpose. According to El-Sayed et al. (2022), educational interventions significantly improved nurse managers' ability to demonstrate resonant leadership behaviors. Kosar et al. (2022) also mentioned the importance of resonant leadership with compassion and mindfulness in reducing workplace bullying in the Kurdistan region. Tiwari and Lenka (2015) highlighted its importance in increasing the engagement of employees, particularly during economic crisis.

Resonant leadership builds a workplace that is harmonious like a symphony, in which all member's strengths are identified and tuned together in harmony. Resonant leaders are like jazz musicians who flow with change seamlessly, converting challenges into opportunities. Having an emotional understanding of their team, they establish trust, cooperation, and a strong sense of belonging. Core values, ethics, and shared purposes form the foundation of organizational culture, while resonant leaders motivate and motivate their people by aligning individual aspirations with workplace goals. They lead from their head and heart, building a relevant and inspiring work environment. Key elements of resonant leadership include emotional intelligence (awareness of the self, controlling the self, awareness of society, and building relationships), awareness, compassion, genuineness, hopefulness, resilience, and good communication. Leaders of high emotional intelligence respond with comprehension and empathy and build positive interpersonal relationships and suppress conflicts like corporate bullying (Kosar et al., 2022).

Present and reflective leaders are unruffled when discussing issues, and with a state of mindfulness and consideration. Empathetic and honest leadership engenders respect and confidence, hope and

optimism motivate groups through hard times (Tiwari & Lenka, 2015). Strong leaders drive teams through change with confidence, bringing innovation and adaptability. Good communication also strengthens the team by getting everyone heard and valued. Overall, resonant leadership fosters trust, emotional well-being, engagement, and long-term success, enabling organizations to thrive even in difficult times.

2.3 Advantage of Resonant Leadership

Resonant leadership offers several important benefits, including increased employee motivation and engagement by fostering an emotionally supportive workplace where individuals feel valued, resulting in higher productivity, job satisfaction, and lower turnover (El-Sayed et al., 2022). It also strengthens teamwork and trust by promoting open communication, empathy, and mindfulness, which encourages collaboration, creativity, and reduced conflict. Moreover, resonant leaders enhance organizational resilience through emotional stability and optimism, enabling teams to effectively navigate change and crises (Kosar et al., 2022). In addition, this leadership style supports employee well-being by encouraging ethical decision-making, mindfulness, and work-life balance, thereby reducing stress and burnout (Cohen et al., 2003). Ultimately, resonant leadership contributes to long-term success by building authentic, lasting relationships that drive innovation, loyalty, and sustainable growth (El-Sayed et al., 2022).

2.4 Disadvantages of Resonant Leadership

Despite its strengths, resonant leadership presents several challenges. Maintaining emotional intelligence and positivity requires substantial energy and self-awareness from leaders, increasing their risk of burnout (Kosar et al., 2022). It may also be less effective in high-pressure, fast-paced environments where swift decision-making and authority take precedence over emotional engagement (El-Sayed et al., 2022). Additionally, excessive emotional involvement can cause leaders to prioritize harmony over accountability, potentially leading to the avoidance of difficult decisions (Tiwari & Lenka, 2015). Some employees may not respond well to emotionally focused leadership, instead preferring a more directive and structured approach. Finally, developing resonant leadership skills demands time, self-reflection, and ongoing emotional intelligence training, which can be difficult without adequate organizational support (El-Sayed et al., 2022).

2.5 Consequences of Resonant Leadership

Depending on how it is implemented, resonant leadership can have both positive and negative effects within an organization. One of its key benefits is the creation of an engaged and motivated workforce, where employees feel heard, valued, and emotionally connected to their work—leading to higher productivity, job satisfaction, and commitment to organizational goals. Open communication and trust, core elements of this leadership style, also enhance team morale and collaboration. Kosar et al. (2022) found that resonant leadership, marked by compassion and mindfulness, helped reduce workplace bullying in the Kurdistan region. It also improves organizational adaptability and resilience, as emotionally intelligent leaders help teams handle stress and uncertainty more effectively. Over time, resonant leadership fosters a culture of ethical behavior, emotional intelligence, and mutual respect, encouraging innovation and attracting talent. However, it can also lead to emotional exhaustion for leaders who fail to balance empathy with self-care. El-Sayed et al. (2022) noted improvements in leadership practices among nurse managers following targeted training, while Cohen et al. (2003) linked emotional well-being with better physical health. Challenges include delayed decision-making due to the emphasis on consensus and the risk of prioritizing harmony over accountability, which can lower team performance. While resonant leadership is powerful, it requires self-awareness, balance, and organizational support to be truly effective.

2.6 Limitations of Resonant Leadership

Humans While resonant leadership offers numerous benefits, it also presents notable limitations that must be considered in organizational contexts. One significant limitation is its potential incompatibility with certain organizational cultures or high-pressure industries—such as emergency services, law enforcement, or competitive sales—where quick, decisive action is critical, and directive leadership may prove more effective than emotionally driven approaches. Furthermore, resonant leadership places a high demand on emotional intelligence and self-awareness, qualities that not all leaders inherently possess. The development of these traits requires considerable time, reflective practice, and training, making successful implementation challenging for some individuals (Tiwari & Lenka, 2015).

Additionally, the effectiveness of resonant leadership is not universal across all employee groups. Some individuals may prefer a more structured, task-focused leadership style that prioritizes

efficiency, clear goals, and direct communication over emotional engagement. In diverse teams, this variation in preference can reduce the overall impact of resonant leadership. Another challenge lies in balancing emotional connection with performance expectations. Excessive emphasis on emotional well-being may lead to reduced accountability, declining productivity, or missed deadlines if not managed carefully (Tiwari & Lenka, 2015).

Finally, resonant leadership is inherently time-consuming, as it requires continuous emotional engagement, relationship-building, and mindfulness. These demands can be particularly difficult to sustain in high-stress or resource-constrained environments. In such cases, more transactional leadership approaches, which prioritize task completion and efficiency, may be more practical (Kosar et al., 2022).

leadership does not only comprise decision-making, strategy formulation, or exercising authority. It is about people, particularly relationships. Being able to relate to people positively, motivate them, and encourage good organizational culture sets effective leaders apart. Of all the attributes that bear effective leadership, two are particularly prominent: compassion and mindfulness. Mindfulness allows a leader to be self-aware and to focus on the present, which is fundamental to navigating through challenging situations. Compassion enhances the capacity to feel for, and love, those in leadership positions with the results being people focused. Such attributes merge to form what is known as resonant leadership, with its emotional intelligence that gives credence to the ability to foster trust and lasting achievement (Cohen & Pressman, 2016)

2.7 Mindfulness in Leadership

Mindfulness plays a critical role in resonant leadership, particularly in enhancing employee engagement during periods of organizational stress or economic crisis. According to Tiwari and Lenka (2015), resonant leadership practices rooted in mindfulness have been shown to improve engagement levels, especially in firms navigating challenging economic conditions. In a leadership context, mindfulness refers to a state of conscious awareness in which the leader is fully present, free from distractions, and attuned to both internal experiences and external interactions.

2.8 Help in Resonant Leadership

Help, as a sub-variable of resonant leadership, refers to a leader's ability and willingness to support, guide, and uplift their team members in both professional and personal capacities. Resonant leaders recognize that leadership goes beyond directing tasks; it involves actively assisting employees in their growth, problem-solving, and overall well-being. They offer mentorship, provide resources, and create opportunities for development, ensuring that individuals feel empowered and supported in their roles. Help also extends to fostering a collaborative and psychologically safe environment where employees feel comfortable seeking guidance without fear of judgment. By demonstrating genuine care and involvement in their team's success, resonant leaders inspire trust, loyalty, and higher levels of engagement, ultimately contributing to a more cohesive and productive workplace. El-Sayed et al. (2022) demonstrated that after an educational intervention, nurse managers showed significant improvements in applying resonant leadership practices. Cohen et al. (2003) associated happiness and well-being with lower cortisol levels and improved immune function in workplace settings.

2.9 Compassion in Leadership

Compassion is a fundamental component of effective leadership, involving both empathetic understanding of others' experiences and a willingness to take supportive action. In leadership roles, employees should be viewed as multi-dimensional individuals with emotional, personal, and professional needs, rather than merely as workers. Compassionate leadership requires not only emotional sensitivity but also practical responsiveness to employee needs and concerns. This approach strengthens organizational relationships, enhances employee engagement, and contributes to improved productivity outcomes. Developing compassionate leadership involves several key practices Showing Empathy: Understanding the emotions behind team members' words and body language helps leaders connect more deeply and respond more effectively. Listening and Demonstrating Kindness: Compassionate leaders go beyond verbal encouragement by actively listening and offering thoughtful, meaningful support. Demonstrating Vulnerability: Authentic leadership involves openness; leaders who share personal experiences and show vulnerability inspire trust and encourage others to be authentic in return. Appreciative Recognition: Simple, low-cost acts such as expressing gratitude and acknowledging good work can significantly enhance team morale, loyalty, and collaboration (Dehghanizadeh & Hosseini, 2024).

2.10 Positive Affectivity

Positive Affectivity (PA) refers to an individual's dispositional tendency to experience positive emotional states such as enthusiasm, joy, alertness, and optimism. As a core component of emotional well-being, PA has been linked to a wide range of beneficial psychological, social, and physiological outcomes. Individuals high in PA are generally more motivated, confident, and resilient, and they tend to demonstrate stronger coping mechanisms in stressful situations. Unlike Negative Affectivity (NA), which involves distress and aversive mood states, PA is a relatively independent trait with distinct biological and psychological correlates, including activation of the left prefrontal cortex and the dopaminergic system (Isen, 2020).

Research has shown that PA contributes to improved mental health, reduced risks of depression and anxiety, and better emotional regulation. It also supports higher levels of self-efficacy and engagement, especially in demanding work environments. Fredrickson's broaden-and-build theory emphasizes that positive emotions expand individuals' cognitive and behavioral repertoires, encouraging creativity, problem-solving, and the formation of social bonds. PA not only facilitates adaptive functioning but also helps build enduring psychological resources that promote long-term personal and professional development (Gloria, Faulk, & Steinhardt, 2017).

In occupational contexts, PA has been associated with increased job satisfaction, improved interpersonal relationships, and reduced burnout, especially in high-stress sectors such as healthcare and education. For instance, healthcare professionals with high PA are more likely to maintain emotional stability, deliver better patient care, and contribute to a collaborative work culture. Similarly, in educational settings, teachers with high PA foster more supportive and effective learning environments, enhancing student motivation and academic outcomes Mitleton-Kelly, 2016).

Biologically, PA is linked to better cardiovascular function, lower cortisol levels, and enhanced immune response, indicating its significant role in promoting physical health. While PA is relatively stable, it can vary based on individual emotion regulation strategies and environmental factors. Studies using Latent Growth Mixture Modeling (LGMM) have identified distinct PA trajectories, showing that strategies such as cognitive reappraisal help maintain or increase PA over time, while suppression does not have the same effect (Squires & Tourangeau, 2017)

Overall, PA is a vital component of psychological and physiological well-being. Its influence extends across personal life, workplace performance, and social relationships, making it a key area of focus in positive psychology and leadership research. Understanding and fostering PA can contribute significantly to individual resilience, organizational effectiveness, and long-term health outcomes.

2.11 The Psychological Foundations of Positive Affectivity (PA)

Positive Affectivity (PA) is closely linked to personality traits such as extraversion, emotional intelligence, and self-efficacy. It is moderately heritable, with genetic factors influencing baseline levels of positive emotions. PA is also associated with left prefrontal brain activation, primarily mediated by the dopaminergic system, which plays a crucial role in motivation, mood regulation, and cognitive flexibility. Individuals with high PA tend to process emotional information more effectively, engage in problem-solving, and build stronger interpersonal relationships.

Several psychological theories underscore the significance of PA in shaping human behavior. The Broaden-and-Build Theory posits that positive emotions expand cognitive and behavioral repertoires, promoting creativity, resilience, and psychological growth. The Affective Events Theory explains how workplace experiences trigger emotional responses that affect job satisfaction and productivity. Positive workplace experiences, such as recognition and supportive leadership, enhance PA and contribute to long-term engagement. The Job Demands-Resources (JD-R) Model (Bakker & Demerouti, 2017) suggests that access to supportive job resources, including autonomy and strong social networks, boosts PA, which in turn reduces burnout and improves job performance.

2.12 Positive Affectivity in Workplace and Organizational Settings

Positive Affectivity (PA) is a key factor in workplace behavior, influencing motivation, teamwork, and organizational commitment. Employees with high PA are more engaged, proactive, and resilient, enabling them to handle challenges effectively. Research shows that PA enhances decision-making, problem-solving, and overall efficiency by broadening attention and cognitive flexibility, fostering creativity, and improving performance.

In high-stress environments like private hospitals, PA is crucial for employee well-being and patient care. Healthcare professionals, frequently exposed to emotional and physical stressors, are

at risk of burnout. However, PA acts as a buffer against stress, promoting resilience and emotional stability. Employees with high PA engage better with patients, communicate empathetically, and contribute to a positive work environment, improving patient satisfaction and outcomes (Yoon & Thye, 2019) PA also strengthens team collaboration and social cohesion. Employees with high PA are more cooperative, build strong relationships, and foster a positive organizational culture. This leads to enhanced morale, reduced conflicts, and a motivated workforce. Organizations that promote PA—through leadership support, wellness initiatives, and engagement programs—report lower turnover, higher job satisfaction, and greater productivity (Squires & Tourangeau, 2017).

2.13 The Role of PA in Coping with Stress and Enhancing Resilience

PA significantly enhances coping mechanisms in stressful situations. Individuals with high PA are more likely to adopt active coping strategies, such as problem-solving and cognitive restructuring, which reduces the negative impact of stress and increases resilience. PA also reduces allostatic load, lowering cortisol levels and promoting a balanced autonomic nervous system, supporting long-term health. In contrast, individuals with low PA are more vulnerable to stress-related illnesses (Marques, 2015). is simply dummy text of the printing and typesetting industry. Lorem Ipsum has been the industry's standard dummy text ever since the , when an unknown printer took a galley of type and scrambled it to make a type specimen book. It has survived not only five centuries, but also the leap into electronic typesetting, remaining essentially unchanged. It was popularized in the 2022 with the release of Letraset sheets containing Lorem Ipsum passages, and more recently with desktop publishing software like Aldus PageMaker including versions of Lorem Ipsum.

Types of Study	Quantitative	Quantitative	Quantitative	Quantitative	Quantitative	Qualitative
Place of Study	Italy	Not explicitly stated but likely international	Multiple countries (Gallup's global database, 21 different industries)	United Arab Emirates (UAE)	Kurdistan Region, Iraq (specifically banks in Koya city, Erbil)	United States
Sample Size	399 teachers (74 from primary schools, 140 from middle schools, 185 from high schools)	Includes workplace employees	7,939 business units, 198,514 respondents from various industries	172 employees from a commercial bank in Dubai (originally 183, reduced to 172 due to missing data)	100 questionnaires distributed, 90 returned and used for analysis	Not explicitly mentioned, but includes multiple research samples across different experiments

Study Number	1	2	3	4	5	6
Statistical Package	LISREL	Not explicitly mentioned, likely SPSS, AMOS, or R	Meta-analysis techniques (specific software not mentioned)	Hierarchical multiple regressions (likely SPSS or similar)	SPSS Vr.24 and AMOS Vr.24	Likely SPSS or similar, but not explicitly stated
Aim	To examine how positive affect and self-efficacy mediate the relationship between teaching strategies and job satisfaction	Explore different aspects of happiness and unhappiness in organizational settings, focusing on emotional exhaustion and positive well-being	To examine the relationship between employee well-being, engagement, and business outcomes, testing the happy-productive worker hypothesis	To examine the moderating role of positive affectivity in the relationship between job satisfaction and frustration/quit intentions	To examine how positive affectivity (PA) impacts creative performance (CP) through the mediating role of quality of work life (QWL) in the banking sector.	To examine whether happiness and positive well-being are associated with better health outcomes and to what extent these effects are specific to different health indicators.
Result	Self-efficacy and positive affect act as mediators; teaching strategies alone do not guarantee job satisfaction	Happiness and unhappiness impact workplace performance, emotional exhaustion, and employee well-being differently	Employee engagement positively correlates with business outcomes: higher customer loyalty, profitability, and productivity	High-PA employees have stronger negative reactions to dissatisfaction than low-PA employees, affecting frustration and intention to quit	Positive affectivity significantly influences both quality of work life and creative performance. Quality of work life partially mediates the effect of positive affectivity on creative p	Positive emotions were associated with lower susceptibility to colds and better cardiovascular health. Happiness correlated with lower cortisol levels and better immune function. Well-being was linked to longer life expectancy in some cases.

Study Number	1	2	3	4	5	6
Recommendation	Training programs for teachers should enhance self-efficacy and positive emotions, fostering environments that motivate and support positive emotions	Organizations should enhance employee well-being to reduce emotional exhaustion and improve workplace happiness, tailoring interventions to happiness and stress management	Organizations should promote employee well-being to enhance business performance, with managers providing support, clarifying expectations, and fostering engagement	Organizations should consider dispositional factors when assessing job satisfaction and turnover, recognizing that high-PA employees are more sensitive to dissatisfaction	Banks should hire employees with positive attitudes and replace those who lack engagement or creativity. Organizations should create a healthy, supportive, and engaging work environment.	Encouraging positive psychological well-being as part of public health strategies. Further research to explore causal mechanisms between happiness and health. Interventions that increase positive emotions could have potential health benefits.

Table 3 Exploring the Interplay Between Resonant Leadership, Empowerment, and Employee Engagement

Study Number	**1**	**2**	**3**	**4**	**5**	**6**
Name of Researcher (Year)	Joan IJ Wagner, Sharon Warren, Greta Cummings, Donna L. Smith, Joanne K. Olson (2013)	Masood Hassan, Azeem Qureshi (2019)	X-Y Luan, I Nielsen, R Smyth, and Q-G Zhai Country (2009)	Elizabeth R. Tenney (2016)	Mahfuz Judeh, Jassim AL-Ghasawneh, Hasan AL-Zu'bi, Abdul Hafaz Ngah (2022)	R.A. Baron (Robert A. Baron) (2017)
Title	Empowerment and "Spirit at Work" Impact on RN Job Satisfaction and Organization Commitment	Resonant Leadership at Workplace: How Emotional Intelligence Impacts Employees' Attitudes – A Cross-Sectional Study	The Role of Positive and Negative Affectivity on Job Satisfaction and Life Satisfaction	Does Positivity Enhance Work Performance? Why, When, and What We Don't Know	Linking Resonant Leadership, Psychological Ownership, and Organizational Commitment: The Mediating Role of Employee Empowerment	The Role of Entrepreneurs in Firm-Level Innovation: Joint Effects of Positive Affect, Creativity, and Environmental Dynamism
Types of Study	Quantitative	Quantitative	Quantitative	Review Research	Quantitative	Qualitative
Place of Study	Canada	Pakistan	Daekin University, possibly China	United States	Jordan	Journal of Business Venturing
Sample Size	147 Registered Nurses	200	558	This paper lacks a defined population and sample size because it is a review	232 employees in healthcare organizations	Entrepreneurs (154)

Study Number	1	2	3	4	5	6
Statistical Package	LISREL	SPSS	Statistical package unclear, likely SPSS	This is a review paper that does not conduct statistical analysis	SEM	Hierarchical regression analysis and variance inflation techniques
Aim	To examine the connections among nurses' resonant leadership, structural and psychological empowerment, Spirit at Work (SAW), job satisfaction, and organizational commitment	To examine how resonant leadership affects workers' views at work, particularly focusing on organizational commitment and job satisfaction	To explore the connection between life and work satisfaction and positive and negative affectivity	To investigate if positivity—which includes positive affect, job satisfaction, and subjective well-being—improves productivity at work	To examine how resonant leadership influences psychological ownership and organizational commitment with employee empowerment as a mediator	To investigate the joint effects of positive affect, creativity, and environmental dynamism on firm-level innovation
Result	Resonant leadership and empowerment have a major impact on job satisfaction and commitment; SAW mediates the relationship between job happiness and commitment	Emotional intelligence in leadership improves employee job satisfaction and organizational commitment	Positive affectivity is linked to job and life satisfaction, while negative affectivity can hinder job satisfaction	Subjective well-being leads to higher productivity, but the link is not always consistent due to external factors	Resonant leadership positively influences psychological ownership and organizational commitment; higher levels of empowerment lead to greater employee engagement	Positive affect in entrepreneurs enhances creativity, which leads to firm-level innovation

Study Number	1	2	3	4	5	6
Recommendation	Organizations should engage in leadership development to empower nursing leaders and increase their emotional intelligence; Promote a workplace culture that values Spirit at Work (SAW)	Provide emotional intelligence training for leaders to increase workplace engagement; Encourage open communication and emotional support to boost productivity	Prioritize creating a good work environment to improve employee well-being and address workplace stressors to reduce negative affectivity	Organizations should develop positive well-being programs, self-regulation training, and creativity workshops to reduce burnout	Encourage resonant leadership styles focusing on emotional intelligence and employee engagement; Adopt leadership strategies that increase empowerment	Encourage positive affect among entrepreneurs to foster creativity and innovation; Support positive emotional regulation techniques

The Benefits of the revues Empirical Studies:

- Contemplation of the variables of previous studies contributed to choosing the starting point for the current research, trying to complete what the previous studies reached and start from where they ended in order to shorten time and effort. This study builds on existing research by further exploring the role of resonant leadership and positive affectivity in workplace outcomes.
- Benefiting from previous studies as sources, which facilitated the way for the researcher in building the theoretical and methodological framework for the current study, particularly in examining the impact of resonant leadership on how positive affectivity contributes to organizational commitment.
- Benefiting from previous researchers, as well as the results of their research, in filling part of the voids in the Iraqi library in general and Kurdish in particular with regard to resonant leadership and positive affectivity. This study aims to further develop these concepts in the local context, while also motivating other researchers to take an important step in studying this vital topic.
- Statistical methods used in previous studies contributed to identifying the most important statistical measures and techniques in analyzing resonant leadership and positive affectivity. These methods provide a foundation for understanding the relationship between leadership styles, and employees' workplace experiences.

What Distinguishes the Current Study from the Above-Mentioned Empirical Studies?

- Unlike previous studies, which have examined resonant leadership and positive affectivity in various industries, our study specifically focuses on hospitals in **Sulaymaniyah, Kurdistan**. This focus allows us to examine these dynamics within the healthcare sector, where resonant leadership and positive affectivity have a direct impact on patient care and overall hospital performance.
- While previous studies have explored these in different geographic locations, our research is unique in applying these concepts to private **hospitals in Sulaymaniyah**. To our knowledge, this is one of the first studies to assess the impact of resonant leadership and positive affectivity on organizational commitment within the healthcare sector in this region.

CHAPTER THREE

3 METHODOLOGY

This section of the research describes its methodology. It describes the methods of data collection, measurement, and analysis. The issues of this study focus on examining the impact of resonant leadership on employees' positive affectivity within private hospitals in Sulaymaniyah, Kurdistan Region. Subsequently, a questionnaire was conducted at Anwar Shexa Hospital, Harem Hospital, and Smart Hospital. In total, 103 responses were received. The collected data was analyzed using the statistical package for social sciences software (SPSS). This part explains the research methods including research design, sampling techniques, instrumentation, and the methods of analyzing the data in order to explain the relations of the study variables.

This research utilizes a quantitative approach to assess how resonant leadership influences the positive affectivity of employees in private hospitals in Sulaymaniyah. The selection of quantitative research is appropriate because it facilitates measurement and statistical computation regarding relationships within the data. Data collection was performed by administering a formally crafted questionnaire to the workers at Anwar Shexa Hospital, Harem Hospital, and Smart Hospital. There were 103 responses in total. To test the hypothesis on the magnitude and direction of relationships, among the variables resonant leadership with its components of mindfulness, compassion, and help, and the level of positive affectivity of hospital employees, the data were processed through the Statistical Package for the Social Sciences (SPSS).

Table 4 Questionnaire Items and Researchers on Demographic Information, Resonant Leadership, and Positive Affectivity

No.	Items	Researchers	Number of Question
1.	Demographic Information	Prushe Maged Honia Barzan Kanyaw Salar	According to demographic questions, we have four questions
2.	Resonant leadership	Dalia Khalid Faeq Rawezh Hassan	Ten according to questions based on resonant leadership we have ten questions
3.	Positive affectivity	Warson, D. & Clark, L. A. (1984). Watson, D., Pennebaker, J. W. & Folger, R. (1987). Watson, D. & Tellegen, A. (1985).	According to questions based on positive affectivity we have eleven questions

By conducting research directly in hospitals, we aim to provide **practical and actionable insights for hospital administrators and policymakers** to reduce burnout, and enhance organizational commitment. Our study not only examines these relationships but also explores the role of leadership effectiveness, a factor that has been underexplored in previous studies, particularly in the healthcare context.

CHAPTER FOUR

4 Results

In this chapter, we walk through the results of our survey, which explored the link between resonant leadership and positive affectivity in the workplace. We used Google Forms to collect responses, and all the data was automatically stored in Excel—helping us avoid the kinds of errors that can happen with manual data entry. Furthermore, we went through all the numbers thoroughly using SPSS and Excel data validators.

For the analysis, we worked with SPSS version 29. The chapter follows the same steps we took during the analytical process: starting with data preparation and screening, then moving into descriptive statistics and more detailed inferential tests. Each section explains why we chose certain methods and what the key results seem to suggest.

Data Preparation and Data Screening

The data was run through a data checker in the excel sheet to find any missing data sets which, because we had a validation for each question, we did not find any missing data. Since we were working on a 5-point Likert scale the final data cannot be seen right away. Several procedures must be followed in order to prepare the data for analysis. The procedure usually includes data entry, data cleaning, and data modification.

4.1 Descriptive Analysis of the survey

RL varies (RL1-RL11) show a series of reactions, the means of which varies from 3.24 (near RL2, neutral) to 3.93 (RL1, tilt towards disagreement). Most reactions cluster around the neutral, although RL1 stands out with strong disagreement (31.1% "strongly disagree," 40.8% "disagree"). The RL2 and RL4 have relatively more compromise (18.4% and 24.3% "agreed," respectively), while the RL10 shows remarkable polarization (39.8% "disagree" vs.5% "agreed"). Standard deviations (0.997–1.155) indicate moderate reaction, which has the RL10 and RL11 highest variability. Overall, RL items typically give neutral suggestions for little negative perceptions, reflect the strongest disagreement with RL1, possibly indicating a major area of anxiety.

Table 5 Descriptive Analysis perspective

Variable	Strongly Disagree		Disagree		Neutral		Agree		Strongly Agree		**Mean**	**St. Deviation**

	Disagree	9	8.70%	46.60%		Disagree	8	7.80%	45.70%
	Neutral	27	26.20%	72.80%		Neutral	33	32.00%	77.70%
	Strongly Agree	25	24.30%	97.10%		Strongly Agree	16	15.50%	93.20%
	Strongly Disagree	3	2.90%	100.00%		Strongly Disagree	7	6.80%	100.00%

We looked at how often people chose certain responses for each survey question, especially those related to positive affectivity (PA1–PA10) and resonant leadership (RL1–RL11). Overall, the results leaned toward the positive—most answers skewed in a way that showed people generally agreed with the statements.

For example:

Questions like PA3, PA4, and PA5 had more than 75% of people agreeing or strongly agreeing.

The same went for RL1, RL5, and RL10, which also got a lot of positive feedback. So, taken together, it seems like participants had a pretty favorable view—both of their emotional experiences and how they see their leaders.

4.2 Reliability Analysis test

The Cronbach's Alpha technique, one of the best indicators of reliability for descriptive phrases, was used to determine the consistency of the questionnaire for responders under changing settings and across time.

Table 6 Reliability Analysis test

Variable	Number of Items	Cronbach's Alpha
Resonant leadership on employees	10	0.888
Positive effectivity	11	0.887

To check how consistent the survey items were within each category, we ran a reliability test using Cronbach's Alpha. The numbers came back strong for both of the main areas we were looking at:

- Resonant Leadership scored an alpha of 0.888
- Positive Affectivity came in close with 0.887

These high values suggest that the questions within each set were working well together, giving us confidence that each group of items was measuring what it was supposed to.

4.3 Descriptive Statistics

The group leaned heavily female—about 63%, with the rest identifying as male. That split could've influenced how people responded, especially since earlier studies have pointed out that women often tune in more to emotions and relationships at work.

Table 7 Descriptive Statistics

Variable	Category	N	%
Gender	Female	65	63.10%
	Male	38	36.90%
Age	Less than 23	15	14.60%
	Less than 23, 23–27 years old	1	1.00%
	23–27 years old	54	52.40%
	23–27 years old, 28–35 years old	1	1.00%
	28–35 years old	24	23.30%
	36–49 years old	8	7.80%
Educational Level	No schooling completed	3	2.90%
	Diploma	16	15.50%
	Diploma, Bachelor's degree	2	1.90%
	Bachelor's degree	62	60.20%
	Bachelor's degree, Master's degree	1	1.00%
	Higher diploma	1	1.00%
	Higher diploma, Bachelor's degree	2	1.90%
	Higher diploma, Bachelor's, Master's degree	1	1.00%
	Master's degree	10	9.70%
	Doctorate degree	5	4.90%
Working Experience	Less than one year	18	17.50%
	1–5 years	64	62.10%
	6–10 years	8	7.80%
	11–15 years	8	7.80%
	Sixteen and more	3	2.90%
Marital Status	Single	63	61.20%
	In a relationship	9	8.70%
	Married	31	30.10%

The group leaned heavily female—about 63%, with the rest identifying as male. That split could've influenced how people responded, especially since earlier studies have pointed out that women often tune in more to emotions and relationships at work.

Most of the people filling out the survey were in their mid-20s, give or take. Just over half were between 23 and 27, and another chunk were in their late 20s to mid-30s. So, it's fair to say the results mostly reflect folks still building their careers, which can shape how they see leadership and work place dynamics. The majority had at least a Bachelor's degree—around 60%. Others had either a Diploma or a Master's, though in smaller numbers. It's a fairly educated crowd overall, which might explain why they could express their thoughts on leadership and emotions in the workplace pretty clearly.

More than half were single, with around 30% married. That part of a person's life can definitely color how they feel about work, especially when it comes to emotional energy, support systems, and how leadership comes across during stressful moments.

4.4 Correlation Analysis

We ran a Pearson correlation to check if there was any kind of connection between resonant leadership and positive affectivity, and it turns out there was a pretty strong one.

The correlation came out to $r = .644$, and it was statistically significant ($p < .001$), which basically means the result is very unlikely to be due to chance.

Correlations			
		Positive_affectivity_DEP	**Resonant_leadership_IND**
Pearson Correlation	Positive_affectivity_DEP	1	0.644
	Resonant_leadership_IND	0.644	1
Sig.(1-tailed)	Positive_affectivity_DEP		0
	Resonant_leadership_IND	0	.
N	Positive_affectivity_DEP	101	101
	Resonant_leadership_IND	101	101

We ran a Pearson correlation to check if there was any kind of connection between resonant leadership and positive affectivity, and it turns out there was a pretty strong one.

The correlation came out to $r = .644$, and it was statistically significant ($p < .001$), which basically means the result is very unlikely to be due to chance.

What this tells us is that when people saw their leaders as more in tune, emotionally aware, and supportive—that is, showing traits of resonant leadership—they also tended to report feeling more positive at work. It's not just a small link either; the strength of the relationship suggests that leadership style might really have an impact on how employees feel emotionally day to day. So, the better the leadership, the better the mood, at least based on what we're seeing here.

4.5 Regression Analysis

We applied a linear regression to quantify how much resonant leadership drives positive affectivity among employees using the regression coefficient. The overall model was highly significant ($p < .001$), with resonant leadership accounting for 41.5 % of the variance in positive affectivity ($R^2 = .415$). The standardized regression coefficient ($\beta = .644$) underscores a substantial positive effect—each one-unit increase in perceived resonant leadership corresponds to a .644-unit rise in employees' positive affect. These results highlight the practical importance of fostering resonant leadership behaviors to enhance workplace well-being.

Table 8 Dependent Variable: Positive_affectivity_DEP

Coefficients								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	1.245	0.317		3.922	0	0.615	1.875
	Resonant_leadership_IND	0.699	0.083	0.644	8.383	0	0.534	0.865

4.6 Findings

Our findings offer strong support for the link between resonant leadership and employee positive affectivity. In light of these results, we recommend that organizations prioritize leadership development programs focused on emotional intelligence, empathy, and authentic engagement—particularly when leading a largely young, well-educated workforce. By integrating these practices into future training and development efforts, companies can simultaneously bolster leadership effectiveness and foster a more positive, resilient work environment. Ultimately, investing in resonant leadership not only enhances employee well-being but also drives productivity, collaboration, and organizational success. Future research should explore specific interventions and longitudinal impacts to comprehensively optimize leadership strategies further.

1. Characteristic Results According to the investigation, staff members at private hospitals had a very favorable opinion of both resonant leadership and positive affectivity: * Positive Affectivity (PA): More than 75% of respondents selected "Agree" or "Strongly Agree" for items PA3, PA4, and PA5. This indicates that workers are highly emotionally engaged, satisfied, and in a good mood at work.

Resonant Leadership (RL): * Responses to items such as RL1, RL5, and RL10 were overwhelmingly positive. In general, participants thought their leaders were considerate, supportive, and emotionally intelligent—qualities that are in line with resonant leadership.

2. Analysis of Reliability Cronbach's Alpha revealed that both scales have outstanding internal consistency: * Positive Affectivity: $\alpha = 0.887$ * Resonant Leadership: $\alpha = 0.888$ These figures attest to the validity and consistency of the questionnaire items for both variables.

3. Correlation Analysis

A Pearson correlation test was employed to examine the relationship between the two variables:

$r = 0.644$, $p < 0.001$

This indicates a positive and statistically significant correlation. With increasing resonant leadership, employees' positive affectivity increases.

Chapter five

5 Conclusion

This research provides a comprehensive analysis of resonant leadership and positive affectivity influence workplace well-being. By focusing on private hospitals in Sulaymaniyah, this study contributes to a deeper understanding of leadership effectiveness in the healthcare sector. The findings will be instrumental in guiding leadership development initiatives fostering a more engaged and committed workforce. This study demonstrated that employees' emotional health and positive affectivity at private hospitals are positively and statistically significantly impacted by resonant leadership, which is defined by compassion, mindfulness, and support. Emotionally intelligent and aware leaders foster a supportive and psychologically secure work atmosphere that boosts engagement, motivation, and job satisfaction. The results show that employees under resonant leadership are more likely to experience positive emotions such as enthusiasm, optimism, and psychological resilience. this benefits organizational outcomes including increased productivity, more engagement, and decreased burnout in addition to the well-being of individual employees. Additionally, by implementing global leadership principles in a regional hospital setting, the results close a research gap in the Kurdistan Region.

5.1 Recommendation

This study showed that resonant leadership characterized by compassion, mindfulness, and support has a favorable and statistically significant impact on the emotional well-being and positive affectivity of staff members at private hospitals. A supportive and psychologically safe work environment is created by emotionally intelligent and conscious leaders, which increases motivation, engagement, and job satisfaction. The findings indicate that positive feelings like excitement, optimism, and psychological resilience are more common among workers under resonant leadership. In addition to the welfare of individual workers, this improves organizational results including higher engagement, more productivity, and lower burnout. Additionally, the findings fill a study need in the Kurdistan Region by applying global leadership principles in a localized hospital environment
