ACKNOWLEDGMENT

We would like to express our sincere appreciation to our research supervisor, Dr. Dalia Khalid Faeq, for her invaluable assistance, insightful counsel, and helpful criticism throughout the course of the study. Being under her supervision has been a huge blessing for us. Her constant input, advice, and support at each stage of our research helped us stay on task and make progress toward producing a well-rounded and insightful study. Additionally, we would like to express our gratitude to Dr. Mustafa Hassan, the head of our department, for his support and encouragement in helping us finish our research. We were given the chance by Komar University, which enabled us to strengthen our academic preparation. We have had the pleasure of getting to know a variety of people at Komar University who have provided excellent guidance and support throughout our Bachelor journey. Finally, we want to thank and recognize our own family. We are proud of what we have accomplished, but we also acknowledge that we would not be where we are today if it weren't for the crucial role that each of the aforementioned people has played. This is one of the greatest and most consistent sources of inspiration, motivation, strength, and support we have experienced throughout our years of study.

Abstract

This empirical study seeks to examine the effect of purchase intention within the scope of corporate social responsibility. Via the housing sector in Garden City in Sulaymaniyah City, Kurdistan Region, Iraq. For conducting this study, the data was collected through primary sources using a survey questionnaire to collect data from 181 customers. The obtained data were analyzed using statistical analysis tools like SPSS V.24. The results showed that there is a relationship between corporate social responsibility and purchase intention. Following the recommendation, The Halabja Group should seek to increase the level of corporate social responsibility by using the appropriate strategic direction towards achieving their goals, and that is by setting short-, medium-, and long-term plans to achieve the goals.

Keywords: Corporate social responsibility (CSR), Economic, Social, ethical, and philanthropic, Purchase Intentions, Halabja Group, Sulaymaniyah, Kurdistan Region, Iraq

Introduction

Corporate social responsibility (CSR) is a valuable tool for businesses to engage in environmental and social projects and a powerful marketing tool that is gaining in popularity (Fernando and Jason, 2021). Some studies will be undertaken as part of this research, one of which looked at how the degree of proactivity in a company's CSR communication strategy affects consumer attitude and, ultimately, consumer intentions (Schiefelbein, 2012). CSR must be considered as an investment that pays off for the organization as a business strategy. While significant corporations generally include CSR in their daily operations, this may not be the case for smaller firms (e.g., tiny, locally owned businesses) that face financial, capital, and market access challenges (Jimenez, 2016). The likelihood that a consumer intends to purchase a product is the most straightforward definition of purchase intention (Peña-García, 2020). Furthermore, CSR activities have a significant impact on a company's image, consumer purchase intent, and long-term performance (Lee & Lee, 2015). The likelihood that a consumer will purchase a good or service is known as purchase intent (Peña-García, 2020). Marketers use predictive modeling to assess purchase intent by identifying the likelihood of potential future outcomes based on historical data (Peña-García, 2020).. A core set of variables is typically used in modeling and includes elements like demographics, website engagement, previous purchases, interaction with marketing messages, and in B2B marketing, webcast or event attendance (Shibin Zhang, 2020). In order to determine which factors have the biggest effects, data from various sources must be combined when evaluating purchase intent. The information is used to inform marketing strategies and to improve messaging across various channels of marketing and communication. Gaining knowledge about the efficacy of an offline or online media campaign and determining whether the money spent on marketing initiatives has an acceptable return on investment are important goals of purchase intent assessment (ROI) (Liu,2020). Delivering the right message to the right audience at the right time is the ultimate goal of purchase intent analysis. As a result, it is critical to know what CSR actions and elements may or may not work for both small, locally owned businesses and huge, international corporations (Zamagni, 2020). The purpose of this study is to find out what CSR is and examine the effect of purchase intentions for the Halabja Group. This company invests heavily in CSR for its customers, in Garden city, especially in the housing sector.

Problem statement

Despite the existence of several CSR-related studies conducted at the organizational level (Farooq et al., 2014; Muchiri & Kiflemariam, 2019; and Singh, 2021) as well as at the employees level (Ilkhanizadeh and Karatepe, 2017; Setyaningrum & Haryono, 2018; and Chang et al., 2021). Little is known about the association between CSR practices and customer outcomes (Ashraf, Ilyas, Imtiaz & Tahir, 2017). However, it is necessary to assess the customers' responses to CSR (Abbas & Shah, 2018; and Islam et al., 2021). CSR can be defined as behavior: If CSR is simply defined as corporate philanthropy, then a billion-dollar corporation giving a hundred dollars while continuing to pollute large swaths of the environment qualifies as practicing CSR. According to our preliminary investigation, we found out that people do not buy houses as much as before from Halabja Group in Sulaymaniah city- Kurdistan Region- Iraq. That could be because they did not follow CSR philosophy.

Objectives

- To clarify the concepts of Corporate social responsibility (CSR) and purchase intention
- To determine the effect of corporate social responsibility on purchase intention.
- To identify the most important factors that enhances Purchase intention.

Literature review

2. Studies on CSR

CSR originated in 1953 when Bowen first proposed the idea of requiring businesses to consider certain factors in their decisions and activities. As the private sector's role in civil society formation has grown, numerous conceptions of CSR have emerged around the world. Bowen (1953) defined the contemporary classification of CSR first. According to the decision, the organization's primary obligation is to be accountable for its actions in a broader context than that defined by its income testimonials. The CSR association demonstrates the organization's position, performance, and actions regarding its public obligations (Brown & Dacin, 1997a).The most well-known are the "CSR stakeholder" and "CSR pyramid" theories (Freeman, 1984). (Carroll, 1991). As a result of the practical and scientific emphasis on CSR, a variety of definitions have emerged. The main difference between them is their perception of the key dimensions of CSR. The three dimensions of CSR are social, economic, and environmental. In some studies, we can find specific types as a four-dimensional approach that deals with formal CSR "practices, constituted by (a) the physical environment, (b) the working environment, and (c) labor standards/working conditions, including standards and systems, and (d) informal practices, constituted by informal arrangements between management and employees (loans, leave, and the like" (Jeppesen et al., 2012) CSR is defined as "an umbrella word for several theories and practices all of which recognize the following: (a) that businesses bear responsibility for their influence on society and the environment, which extends beyond legal compliance and individual liability; and (b) that businesses bear responsibility for the behavior of others with whom they do business. (e.g. within supply chains); and (c) that companies need to consider the impact of their operations on society and the natural environment" (Blowfield and Frynas, 2005). There are also many CSR definitions developed by international organizations, particularly the World Bank, the EU, the UN Global Compact, the World Business Council for Sustainable Development, the Global Reporting Initiative, and others, which represent a practical approach to CSR. These definitions emphasize companies' contributions to sustainable development at various levels, as well as the growing importance of CSR strategic focus (Porter and Kramer, 2006). In a seminal article, Carroll (1979) defined corporate social responsibility as "society's economic, legal, ethical, and discretionary expectations of corporations at any given time. “Carroll

argued in his definition that these responsibilities are carried out not only for the benefit of the firm but also for the benefit of society as a whole. This means that organizations, by their very existence, can be viewed as entering into a social contract that obligates the corporation to consider the interests of society when making decisions (Andreasen & Drumwright, 2001). CSR has been described using a variety of theories and definitions (Vlachos, Tsamakos, Vrechopoulos, & Avramidis, 2009). According to Baron (2007), CSR is an important factor in organizational strategies, which leads to an increase in the number of organizations in the international market. Market strategies, as well as non-market strategies, have a direct impact on an organization's performance in the market (Nakayama, 2007). It means that an organization should set both organizational and social and environmental goals. External collaboration encompasses all methods of interacting with external stakeholders to implement an organization's CSR agenda, such as collaborations with civil society institutions, participation in CSR-related networks, and actions (Baumann-Pauly et al., 2013). The CSR stages approach is based on Zadek's (2004) organizational learning model and is defined as follows: The denial stage refers to the company's refusal to incorporate CSR principles into its operations. The compliance stage denotes the emergence of a company's activities that are focused on legal requirements The managerial stage begins the process of comprehending the company's responsibilities and incorporating CSR into managerial practice The strategic stage denotes deeper firm involvement in CSR practices, including integrating CSR into company strategy and understanding it as a competitive advantage; the civil stage denotes a qualitatively new level of CSR activities, such as industry and civil society collaboration and other forms of proactive CSR behavior (Baumann-Pauly et al., 2013). Dahlsrud (2008), on the other hand, identifies five dimensions of CSR: communal, eco-friendly, sponsors, monetary, and volunteer. Carroll (1991) proposed four levels of CSR (pyramid): economic, legal, ethical, and philanthropic. The author defined economic responsibility as a corporation's expectation to maximize earnings per share. The obligation to obey laws and regulations is referred to as legal responsibility. Ethical responsibility is the responsibility of doing what is expected morally and ethically, whereas philanthropic responsibility refers to societal charitable expectations for the corporation. Based on these four components, a socially responsible company should strive to make a profit, follow the law, be ethical, and be a good corporate citizen. Mohr, Webb, and Harris define CSR as "a corporation's commitment to minimizing or eliminating any harmful effects and maximizing its long-run beneficial impact on society" (2001).According to the authors, socially responsible behaviors include a wide range of actions such as acting ethically, supporting the work of nonprofit

organizations, treating employees fairly, and minimizing environmental damage. In other words, a socially responsible corporation would consider the consequences of its actions on all people who are directly or indirectly related to the corporation.

2.1 Economic

Previously, corporations' social responsibility has been equated with their economic. Economics is the fundamental unit of a corporation in business institutions (Carroll, 1979). Corporations should provide goods and services that society desires at reasonable prices in order to fulfill their economic responsibility to society. Furthermore, corporations have an economic responsibility to themselves, that is, to make profits so that they can continue to provide goods and services that society requires and wants at reasonable prices. They must also pay their employees, increase shareholder value, and protect the interests of other stakeholders (Carroll, 1979). Economic responsibility is regarded as a fundamental obligation of corporations. According to Maignan and Ferrell (2004)'s research, in the United States, claiming to be a socially responsible organization when economic achievements are not the best can be dangerous. Maignan and Ferrell (2004) cited the ice cream manufacturer Ben and Jerry's Inc., which has been repeatedly accused of ignoring economic performance due to its numerous philanthropic activities. According to McAlister, Ferrell, O. C., and Ferrell, L. (2005), the way a corporation interacts with its stakeholders, such as shareholders, employees, suppliers, competitors, community, and even the natural environment, has an impact on the economy. Economic responsibility entails maximizing not only the interests of shareholders but also the interests of other stakeholders

2.2 Legal

Corporations are expected to work within the framework of laws and regulations in carrying out their economic responsibilities as partial fulfillment of the "social contract" between corporations and society. Carroll (1991) stated that it is critical for legal to be carried out in a way that is consistent with the expectations of governments and laws while adhering to the various federal, state, and local regulations. A successful corporation is one that follows through on its legal obligations. According to Conchius (2006), legal responsibility includes adhering to consumer and product laws, environmental laws, and employment laws, as well as laws and regulations governing marketplace competition. However, legal responsibilities do not cover the entire range of behaviors that society expects of corporations. Laws are important, but they are frequently insufficient. For starters, they cannot possibly address all of the issues or areas of concern that a company may face. Second, laws frequently lag behind more recent concepts of what is considered appropriate behavior, and third, laws may represent legislators' personal interests and political motivations (Carroll, 1999).

2.3 Ethical

This is supported by Creyer and Ross (1997), who conducted a survey of elementary school students' parents to assess their attitudes toward corporate ethics. They discovered that the majority of respondents expected corporations to conduct their operations ethically. Some respondents even stated that they were willing to pay a higher price for products produced by ethical corporations. Although economic and legal responsibilities represent ethical standards of fairness and justice, ethical responsibility encompasses those activities and practices that society expects or forbids that go beyond the scope of legal responsibilities. Ethical responsibility encapsulates the standards and expectations that reflect a concern for what consumers, employees, shareholders, and the community regard as fair, just, or consistent with the respect or protection of stakeholders' moral rights (Carroll, 1979). According to Carroll (1991), a corporation's consistency in promoting morale and ethical standards can determine its business performance. When a corporation practices good corporate citizenship, its activities are trusted. Ethical responsibility also acknowledges that corporate integrity and

ethical behavior should go above and beyond the requirements of laws and regulations. It is critical to strike a balance between economic, legal, and ethical responsibilities. If the corporation does something that is both economically and legally sound, it must also be ethically sound.

2.4 Philanthropic

According to Carroll (1991), it is critical for managers and employees to participate in voluntary and charitable activities within their local communities, particularly in projects that improve the quality of life. The distinction between philanthropic and ethical responsibilities is that philanthropic responsibilities are not expected from an ethical or moral standpoint. Philanthropy is the most voluntary and discretionary aspect of corporate responsibility and it has not always been linked to profits or the firm's ethical culture (Ferrell, 1985). Philanthropic duty refers to corporate acts that are undertaken in response to society's expectations of decent corporate citizens. Corporate philanthropy is likely to improve the image of firms, particularly those with a high level of public attention. Corporate generosity should also boost staff loyalty and strengthen consumer relationships. Business contributions in the form of financial resources or executive time, such as gifts to the arts, education, or communities, are examples of philanthropic efforts. Society expects corporations to contribute money, facilities, and employee time to humanitarian programs or purposes, but society does not consider the corporation unethical if it does not achieve the level of philanthropic responsibility. Although society wishes for corporations to be charitable, it is entirely voluntary on the part of corporations (Carroll, 1991). According to Fombrun, Gardberg, and Barnett (2000), the case for philanthropy stems from two sources: strategic philanthropists argue that, while philanthropy may not generate direct economic returns, it will improve the firm's long- term competitive position through intangible gains in reputation, legitimacy, or employee retention.

3. Purchase intention

Purchase intention is a type of decision-making that investigates why a consumer would buy a specific brand (Shah et al., 2012). Tariq et al. (2013) define purchase intention as a situation in which a consumer is inclined to purchase a specific product under certain conditions. "Intention represents a person's immediate behavioral orientation toward engaging in a given behavior and it reflects the person's motivation toward that behavior," it is suggested (Hagger et al., 2002, p. 4). Purchase intention is an essential term in marketing, and authors in the literature discuss and analyze it in a variety of ways. According to Axelrod (1968), purchase intention is studied with other attitude indicators used to predict actual purchase behavior. Product values and recommendations obtained from advertising or from other users, according to Jamieson and Bass (1989) have the biggest influence on determining whether to purchase a given product. Purchase intention, according to Mirabi et al. (2015), is a complicated process related to customer behavior, perceptions, and attitudes, making it an excellent tool for predicting the purchasing process. Furthermore, Armstrong and Kotler (2007) argue that purchasing intent is developed before the buyer makes the ultimate purchase choice. Based on the numerous definitions and interpretations of purchasing intention offered by the authors. It might be claimed that purchase intention is based on a consumer's willingness to acquire a given product or service under certain conditions. According to Dehghani and Tumer (2015), buying intention is a variable that is affected by a variety of external and internal factors, such as price, perceived quality, and value.

Aim	The aim of study uses social exchange theory (SET) and social information processing theory (SIP) to develop the relationships regarding the consequences of CSR and the	This study is designed to measure the power of CSR association on customer loyalty and also to examine the mediation of customer trust, customer identification, satisfaction, and	The purpose of this study is to investigate the effects of consumers' support for CSR activities, CSR fit, and CSR consistency on company evaluations by using diverse CSR	One of the aims of the current paper is to examine leadership effects on the social responsibility of the organizations and the secondary purpose of the study is to investigate employee's perceptions on the	This study aims to obtain the CSR status by Dubai business firms during the crisis and explore the people's awareness of CSR practices among business firms in Dubai. It also explores the relationship between CSR adoption

	mediating role of WE. The previously mentioned relationships are assessed based on flight attendants' perceptions (the individual level of analysis).	commitment in the relationship between CSR association and customer loyalty.	activities.	social responsibility in the Sulaymaniyah city of Kurdistan Region of Iraq.	levels in Dubai firms and other variables such as firm sales.
Hypothesis	**H1.** The economic, legal, ethical, and philanthropic indicators of CSR jointly exert positive effects on flight attendants' WE. **H2.** The economic, legal, ethical, and philanthropic indicators of CSR jointly exert positive effects on flight attendants' (a) career satisfaction and (b) voice behavior.	**H1.** CSR and Customer Trust **H2.** CSR and Customer Satisfaction	**H1.** CSR support has a positive impact on consumers' company evaluations. **H2.** The effects of CSR support, CSR fit, and CSR consistency on company evaluations are mediated by perceived CSR motives.	**H1.** CSR and Ethical leadership **H2.** CSR and transformational leadership	**H1.** Crises positively influence CSR adoption requirements in Dubai firms. **H2:** Crises enhance the community awareness regarding the CSR adoption in Dubai firms.

Result	First, there is a need to emphasize the company's CSR initiatives to candidates during the hiring process Second, voice behavior is one of the important communication strategies among employees.	First, Customer trust positively and significantly mediates the relationship between CSR and CL. It indicates that when Banks do CSR activities for the betterment of society it will increase the trust of their customers in the institute and this will lead them to be loyal to the institute. Second, The findings show that CSR has direct. Impression on CCI and CCI directly influence customer loyalty.	First, consumer's support for CSR activities has a positive and significant influence on perceived CSR motives and company evaluations. Second, we find that CSR support plays the role of a boundary condition on the effectiveness of CSR fit and CSR consistency. When CSR support is high, CSR fit and CSR consistency does not have a significant effect on company evaluation and perceived CSR motive.	The results have shown us that ethical leadership plays much more significant Role in CSR practices toward employees than transformational leadership does.	Firstly, it shows that a large scheme of the Dubai community has a decent level of expertise in sustainability and corporate social responsibility. Secondly, It also shows that firms that have implemented CSR before the crisis will mostly be better suited to play a supportive role for government and society during the crisis.
Recommendation	First, we limited our focus to WE as a mediator pertaining to its relationship with CSR, career satisfaction, and voice behavior. Second, our study used flight attendants' perceptions of career satisfaction and voice behavior as the two important outcomes.	This study examines the mediating role of CT, CCI, CS and CC. Future researchers can also study on these variables in the other service context like education, airline and hospitals, especially in the context of Pakistan as few researchers conduct study on this framework in Asia.	First, future research will need to further investigate the variables related to corporate size. Second, it is necessary to carry out the experiment while using variables that are related to the timing of CSR activity in the context of corporate crisis.	Firstly, CSR activities can be used to provide positive benefits to market organizations. Secondly, the researchers can collect data from all around the country in order to see the whole picture in the region.	Future research could intestate the impact of the sustainability reports on consumer behavior, which could be qualitative research to obtain better relevant results.

Aim	The main motive behind this approach is to increase the customer base for the company through customer education about ecological degradation.	Research aims to understand the intention to adopt electronic channel and determine the precursors of online purchase intention in an emerging economy, and compare them with those in a developed economy through a cross-cultural	The main study for tests and verifies the main factors influencing consumers' intention to purchase and the marketing strategy of remanufactured new-energy automobile parts in China.	This study aims to uncover psychological drivers and barriers (consumption values, social norms, and attitudes to sustainable apparel products) of Chinese consumers' behavioral intentions toward sustainable apparel products (SAP) by exploring the attitude–	The aim of this study is to evaluate the impact of quick response (QR) codes on customer satisfaction and purchase intention in the online shopping context on the basis of perceived flow.

		study.		behavioral intention gap.	
Hypothesis	**H1.** Attitude significantly influences the consumers' purchasing intention towards eco-friendly apparels. **H2.** Subjective norm significantly influences a consumer's purchasing intention towards eco-friendly apparels.	**H1.** Attitude toward e-commerce has a positive effect on online purchase intention **H2.** Consumer online purchase intention has a positive effect on online purchase behavior	**H1.** Subjective norms are positively associated with Chinese consumer intentions to purchase remanufactured new-energy auto parts. **H2.** Attitude is positively associated with Chinese consumer intentions to purchase remanufactured new-energy auto parts.	**H1.** Consumers' attitude toward SAP is significantly different from the SAP purchase intentions. **H2.** Consumption values have a moderating role on the relationship between attitude and purchase intention toward SAP in China.	**H1.** In the online shopping context, customer satisfaction has positively impact on purchase intention. **H2:** Flow, customer satisfaction, and purchase intention

Result	Firstly, Results of the present study show that attitude is a primary factor that helps the formation of purchase intentions toward green apparel. Secondly, It can also promote the fact that eco-friendly apparels can be a good option in tackling environmental pollution and making a reduction in carbon emissions.	Firstly, Colombian consumers are significantly more indulgent than Spanish consumers. Secondly, Colombia is a collectivist country, whose inhabitants' associate purchases with social processes and, therefore, collective processes.	Firstly, In China, perceived risk is positively associated with consumers' intentions to purchase remanufactured new-energy auto parts. Secondly, Remanufactured new-energy auto parts are emerging products in the Chinese market.	Firstly, Chinese consumers' SAP attitudes had a strong positive effect on the purchase intention toward SAP Secondly , aesthetic values positively moderated the relationship between the SAP attitude and purchase intention, whereas conspicuous values negatively moderated the relationship	Firstly, the result indicated that usefulness, acceptability, and feasibility are positively connected with perceived flow; as a result, H1a–c was supported. Secondly, H2a and b was also supported, and customer satisfaction via QR code is positively connected with purchase intention of consumers.
Recommendation	firstly , It can conduct more focused studies on purchase behavior Secondly, it can examine different age groups, make more inferences and create a better understanding of purchase behavior.	Firstly, The study should be conducted based on estimates of national culture of Hofstede and WVS to establish a difference between Colombian and Spanish consumers. Secondly , the study lies in the fact that external factors may and make impact consumer decisions,	Firstly, Relevant parties must ensure that the quality of remanufactured new-energy auto parts is as good as or better than the original parts. When that happens, the level of consumer perceived risk reduces Secondly, Different marketing strategies should be used for different market segments. Consumer needs vary and therefore, market strategies should diversify accordingly.	Firstly, an approach combining quantitative and qualitative research methodology would Help to comprehend consumers' sustainable behaviors in more detail. Secondly, a larger sample size can lead to more rigorous findings of hypotheses testing.	Firstly, it could also test other possible ways of moderating the sample. Secondly, it may comprise diverse emotional components such as enjoyment, perceived excitement, or delight in our proposed model to calculate their consequence on customer satisfaction and purchase intention.

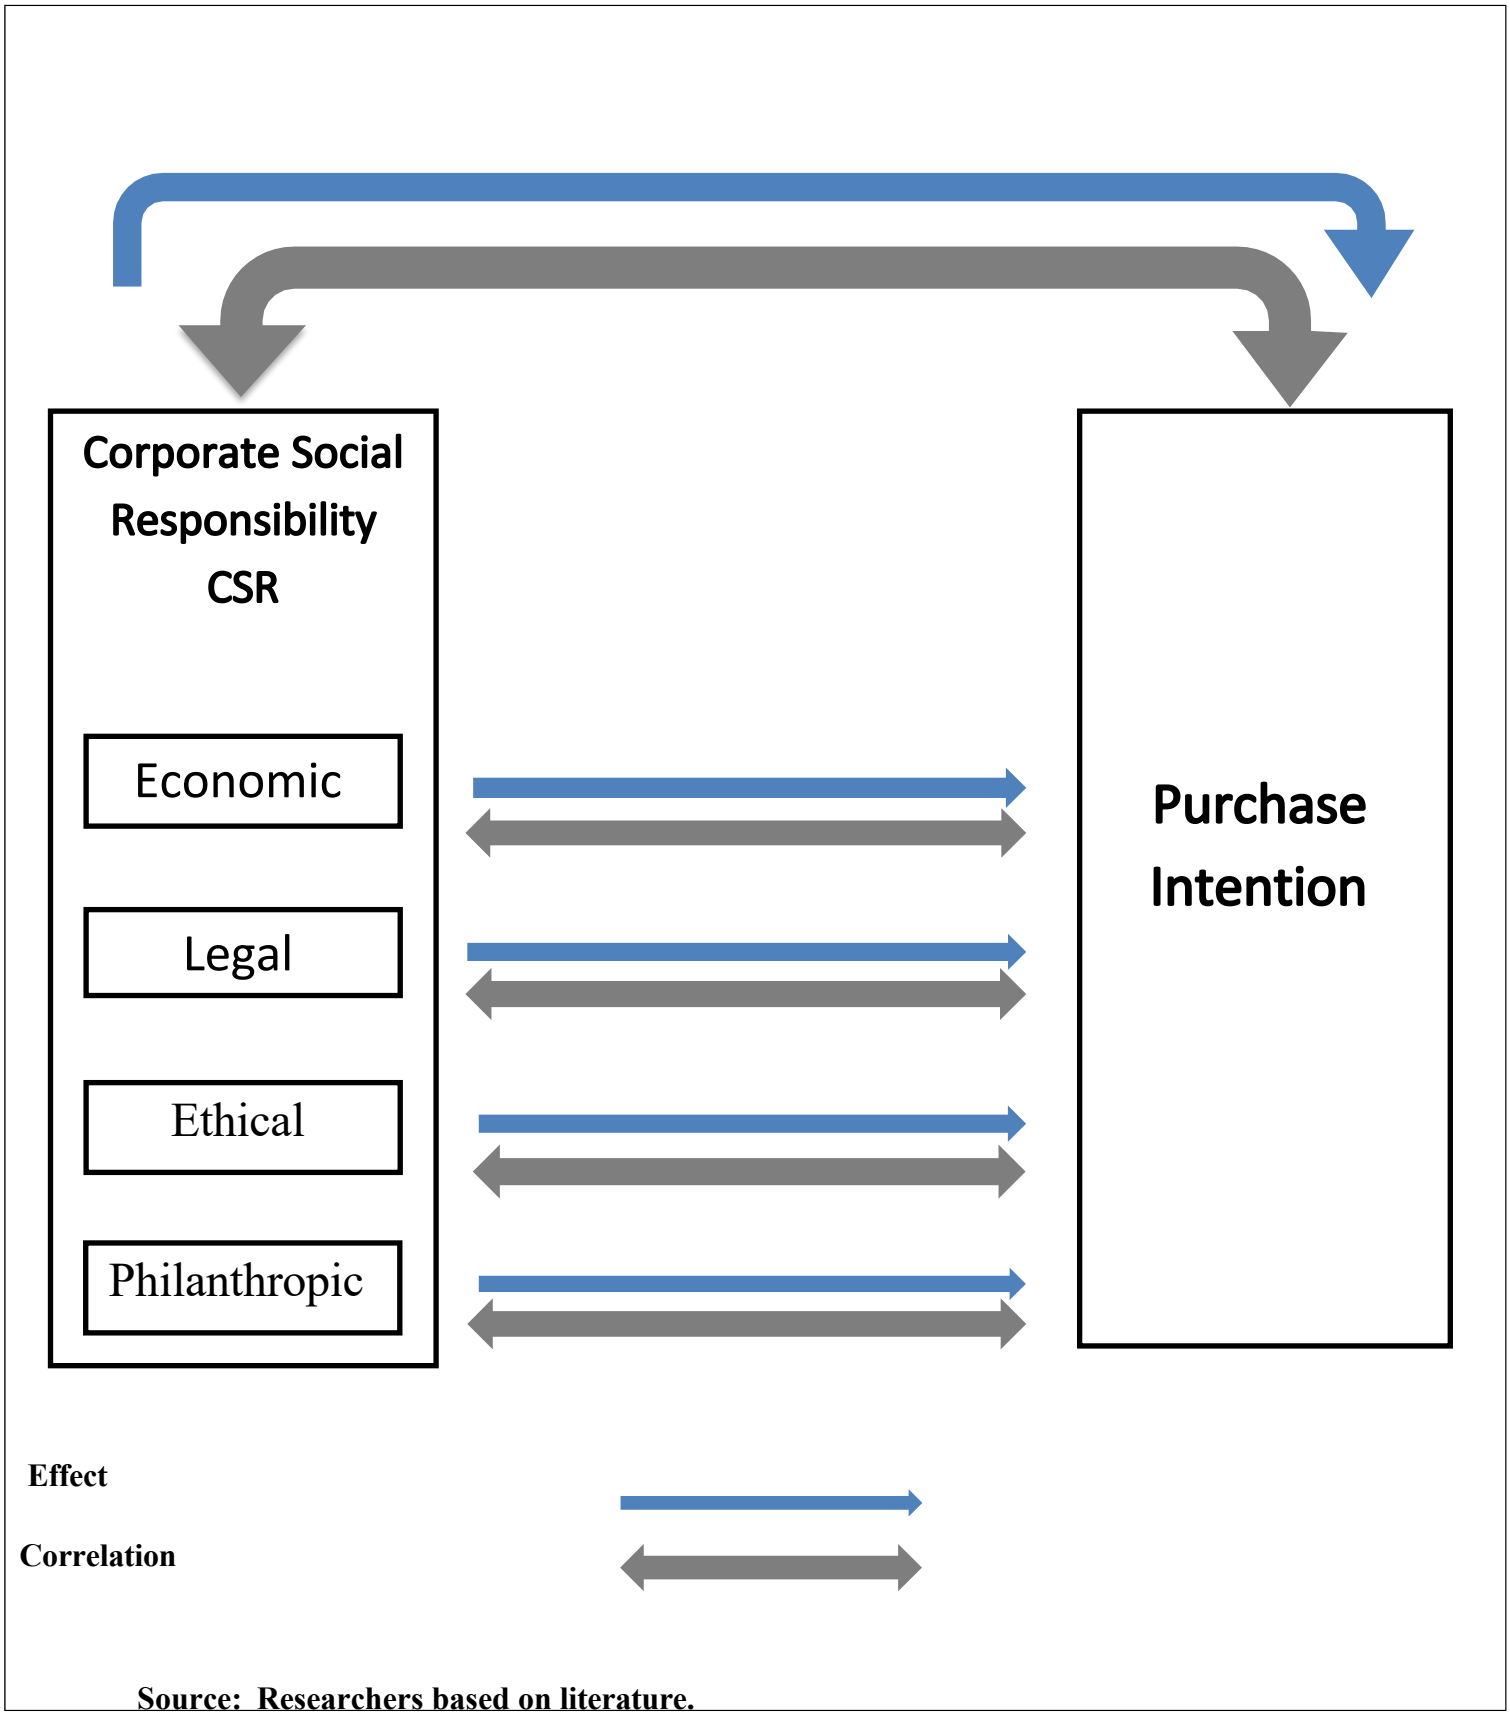
The benefit of the above empirical studies:

- Contemplation of the variables of previous studies contributed to choosing the starting point for the current research, trying to complete what the previous studies reached and start from where they ended in order to shorten time and effort.
- Benefiting from previous studies as sources, which facilitated the way for the researcher in building the theoretical and methodological framework for the current study.
- Benefiting from previous researchers, as well as the results of their research, in filling part of the voids in the Iraqi library in general and Kurdish in particular with regard to the variables of this study, as well as motivating other researchers to take an important step in studying this vital topic.
- Statistical methods that used by Previous studies, contributed to identify the most important statistical measures and means used in obtaining data, and clarifying the relationship between the study dimensions and its variables.

What distinguishes the current study from the above mentioned empirical studies?

- The current study differs from the above mentioned studies in that we have linked two different variables that they did not use before CSR as independent variable and PI as dependent variable.
- The second difference in location is that they have chosen different countries for their research, and most of these countries are repeated, but we apply Kurdistan in Sulaymaniyah, Although one of the studies in the table is on Kurdistan and in Sulaymaniyah at the University of Tishk, our difference with them is that we are the only research that we have done on the housing sector in Garden City in Sulaymaniyah, Kurdistan, Iraq.

Figure 1: Conceptual framework



Source: Researchers based on literature.

Hypothesis

The following are some hypotheses that have been proposed:

H1: There is a significant positive correlation between corporate social responsibility (CSR) and purchase intent.

H1a: There is a significant positive correlation between economy and purchase intent.

H1b: There is a significant positive correlation between social and purchase intent.

H1c: There is a significant positive correlation between ethical and purchase intent.

H1d: There is a significant and positive correlation between philanthropic and purchase intent.

H2: Corporate social responsibility (CSR) has a positive significant effect on purchase intention.

H2a: Economy has a positive significant effect on purchase intention.

H2b: social has a positive significant effect on purchase intention.

H2c: Ethics has a positive significant effect on purchase intention.

H2d: Philanthropy has a positive significant effect on purchase intention.

RESEARCH METHODOLOGY

Research design

To complete the study's practical component, primary data was gathered using a survey questionnaire. The demographic data of the respondents, as shown in Table 3, is included in the questionnaire's first section. The study's independent variable is covered by twenty-four questions in the second section (Corporate social responsibility). Lastly, three (3) study dependent variable-related questions (purchase intention).

A Likert scale with five possible outcomes—1 for strongly disagreeing and 5 for strongly agree employed. The questionnaire was also translated into Kurdish and Arabic using the back translation technique. The hypothesis was tested using SPSS V. 24, which was also used to examine the relationships between the variables using leaner modeling (GLM) techniques like ANOVA or multiple regressions.

Table 3: Design of Questionnaires and References

N.	Items	Researcher	Number of Question
1.	Demographic Information	**Researchers by** : Bostan, MA: Pearson (Bein, 2009)	According to demographic questions, we have four questions.
2.	Corporate social responsibility (CSR)	**Researchers by** : Ilkhanizadeh & Karatepe (Karatepe, 2017)	Twenty-four questions based on CSR questions.
3.	Purchase Intent	**Researchers by** : (Wee et al , 2014)	Three questions that relate to purchase intention.

Source: Researchers based on questioner.

Sample Size and Data Collection: The target population of the current study consists of all customers in the housing sector in Garden City in Sulaymaniyah city, Kurdistan Region – Iraq. At the time of conducting this study, there were customers, as appeared in appendix no. (1). A total of 360 questionnaires were distributed to customers, with 188 of them being usable. In order to avoid bias, the following steps were taken: firstly, sending questionnaires with a cover letter and using a face to face method for data collection, secondly, obtaining the response after one month Vis a face-to- face meeting.

RESULTS AND DISCUSSION

Coding of variables, dimensions, and items

The coding process often requires that the researcher interpret the meaning of variables and dimensions (Kerlinger & Lee, 2000). Therefore, the coding of variables, dimensions and items is shown in Table 3.1.

Table 4

Coding of Variables, Dimensions and Items

Variable	Variable Code	Dimension	Dimension Code	Numbers of Items
Corporate Social Responsibility	CSR	Economic	EC	7
		Legal	L	7
		Ethical	ET	5
		Philanthropic	PI	5
Purchase Intention	PI	----------	----------	3

PROFILE OF RESPONDENTS

Respondents were asked questions about (gender, age, marital status, and education level)

Gender

Table 4.2 shows that 53.72% of the respondents are male, and this indicates the dominance of male employees in research sample.

Table 4.1

Gender of Respondents

	Frequency	Percent	Valid Percent	Cumulative Percent
male	101	53.7	53.7	53.7
female	87	46.3	46.3	100
Total	188	100	100	

As a summary, Figure 4.2 shows the profile of the respondents according to gender.

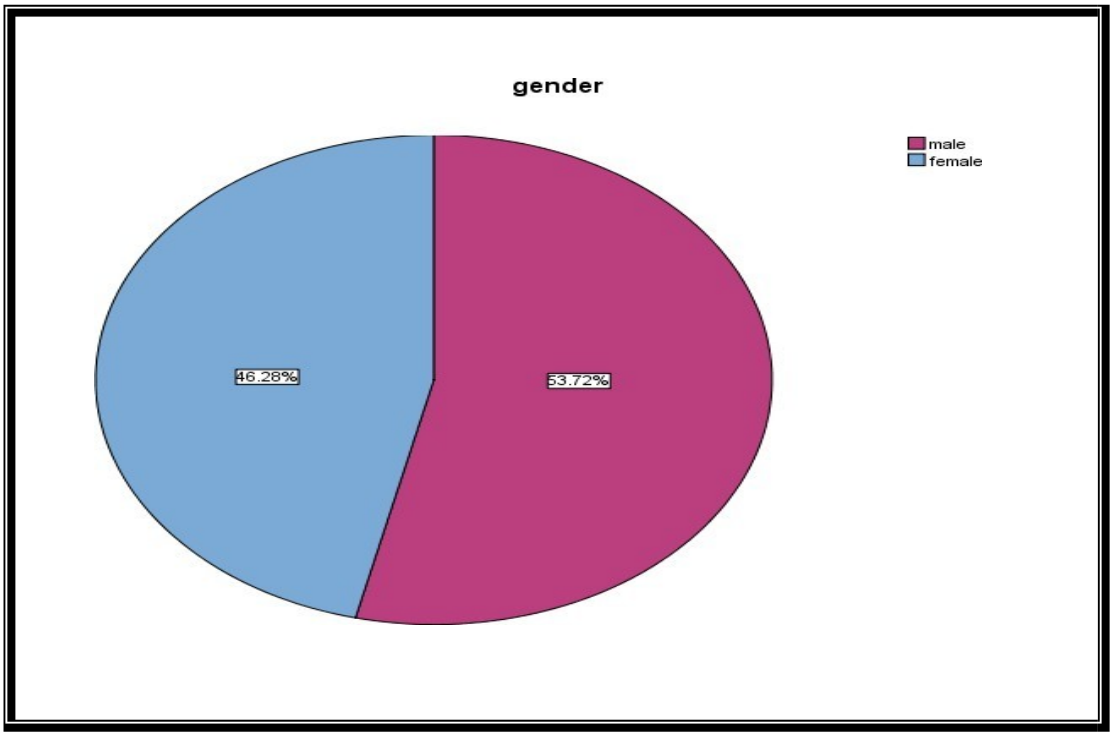


Figure 2.2 Profiles of the Respondents According to Gender

Age

The result in Table 4.3 shows that more of the respondents are between 28 and 35 years old 36.2%. While, the 17.6% are between 23 and 27 years old, 33% are between 36 and 49 years old, and the remaining 13.3% are 50 years old and above.

Table 4.2

Age of Respondents

	Frequency	Percent	Valid Percent	Cumulative Percent
23-27	33	17.6	17.6	17.6
28-35	68	36.2	36.2	53.7
36-49	62	33	33	86.7
>50	25	13.3	13.3	100
Total	188	100	100	

As a summary, Figure 2.3 shows the profile of the respondents according to age.

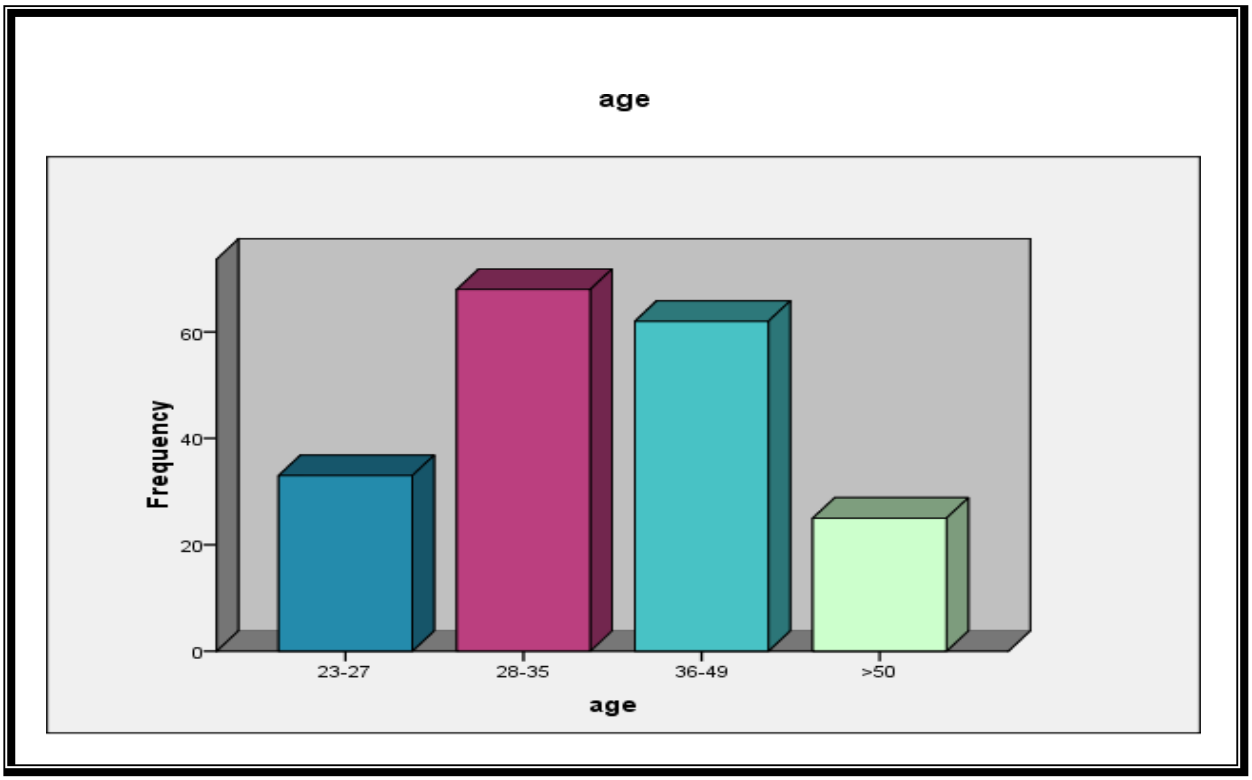

Figure 2.3 Profiles of the Respondents According to Age

Marital status

Table 4.4 indicates that 48.9% of the respondents were married while 20.2% are single (unmarried). Additionally, of the 16.5% from respondents were in the relationship and 14.4% become divorced.

Table 4.3

Marital status of Respondents

	Frequency	Percent	Valid Percent	Cumulative Percent
single	38	20.2	20.2	20.2
married	92	48.9	48.9	69.1
in a relationship	31	16.5	16.5	85.6
divorces	27	14.4	14.4	100
Total	188	100	100	

As a summary, Figure 2.4 shows the profile of the respondents according to marital status.

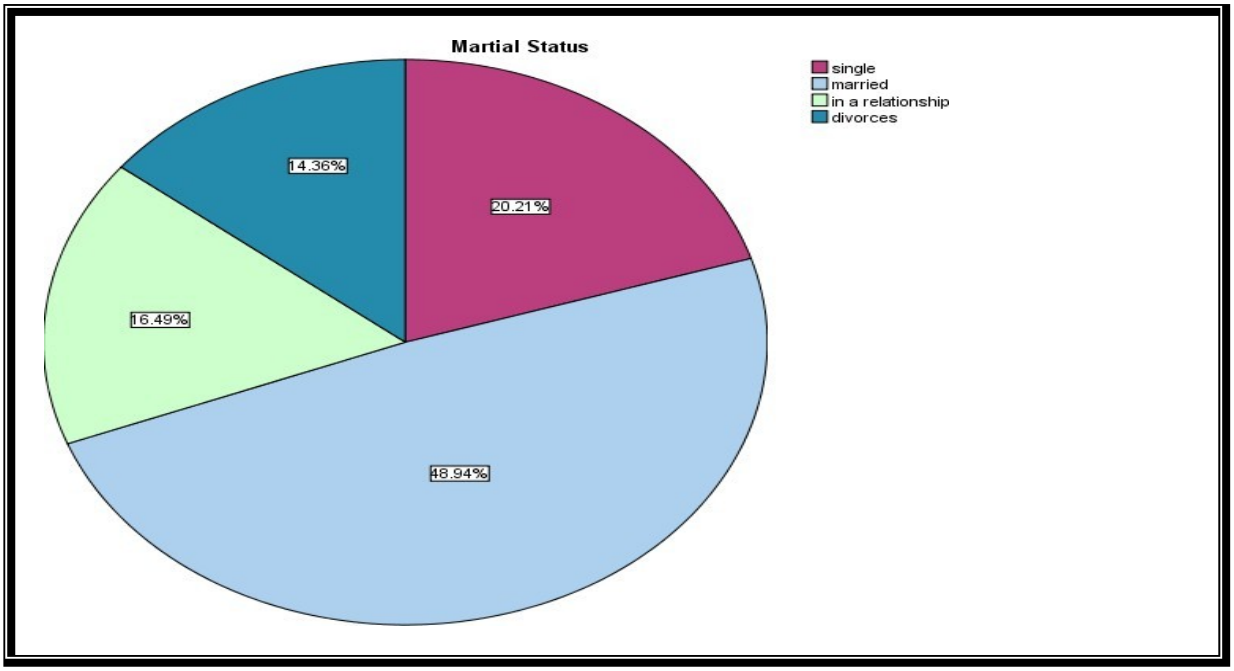

Figure 2.4 Profiles of the Respondents According to Martial Status

Education Level

The result in Table 4.5 shows that 43.6% of the respondents have a bachelor's degree, 11.7 % have a master's degree, 8.5% have a doctorate's degree, and the remaining 13.8% no schooling completed. Additionally, of the 22.3% from some college credit, no degree.

Table 4.4 ***Education Level of Respondents***

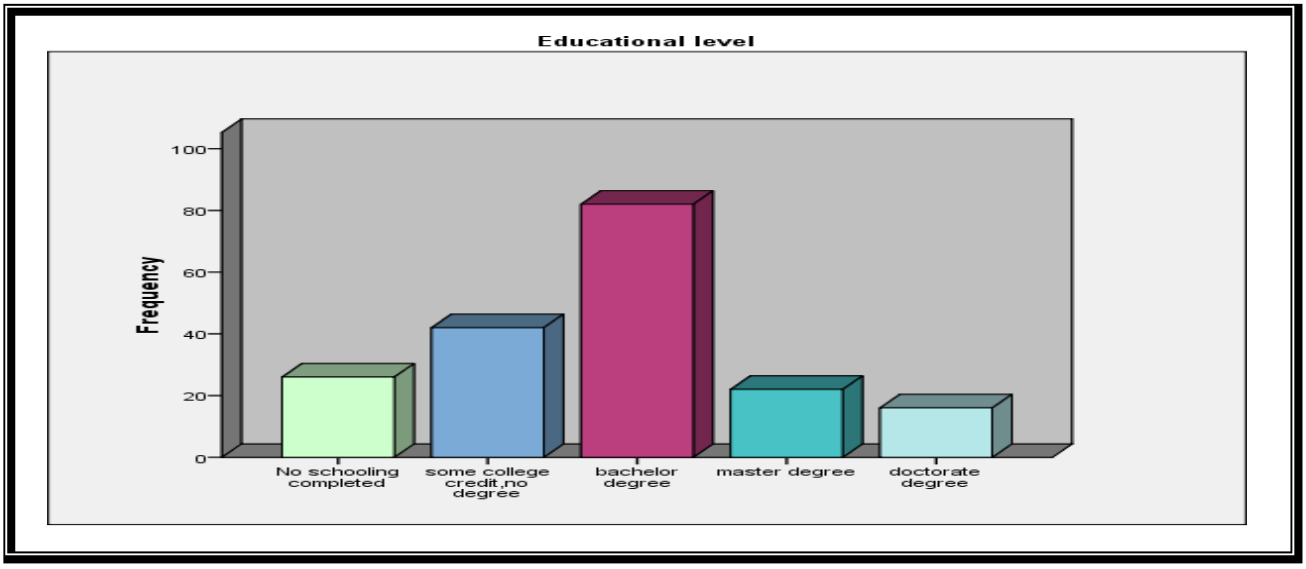

Figure 2.5 Profile of the Respondents According to Educational level

Dimensionality of the Measuring Instrument using Exploratory Factor Analysis

Exploratory Factor Analysis (EFA) is a technique within factor analysis whose overarching goal is to identify the underlying relationships between measured variables (Hair et al., 2017).

Exploratory Factor Analysis of the Corporate Social Responsibility

A test to determine whether your data is appropriate for factor analysis is the Kaiser-Meyer-Olkin (KMO) test. Based on SPSS v.24 results, the KMO measure of sampling adequacy at 0.877 indicates that factor analysis can be conducted on the data. Moreover, Bartlett's test of Sphericity was very large and significant at c2 = 7886.942, with a p < .000. Therefore, the data is more suited to factor analysis. The following Table 3.8 shows the results.

Table 4.5

Kaiser-Meyer-Olkin of the Corporate Social Responsibility (n=188)

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.877
Bartlett's Test of Sphericity	Approx. Chi-Square	7886.942
	df	276
	Sig.	.000

In the context of the Varian rotation method, the outputs of Table 4.6 display that all 24 items were known as an accurate tool to measure four dimensions (economic, legal ethical, and philanthropic)

Table 4.6

Exploratory Factor Loadings of the Corporate Social Responsibility (n=188)

Item	Component			
	1	2	3	4
EC1	.657			
EC2	.634			
EC3	.642			
EC4	.550			
EC5	.808			
EC6	.647			
EC7	.578			
L1			.665	
L2			.646	
L3			.575	
L4			.592	
L5			.559	
L6			.654	
L7			.631	
ET1		.522		
ET2		.625

ET4		.689		
ET5		.706		
P1				.684
P2				.589
P3				.576
P4				.624
P5				.610

Further, the Scree plot (see Fig. 2.6) indicates that the factor loading for this variable as the curve started to flatten after the individual factor. Thus, all these factors statistically

confirmed that the loading of corporate social responsibility items was very suitable for the current research.

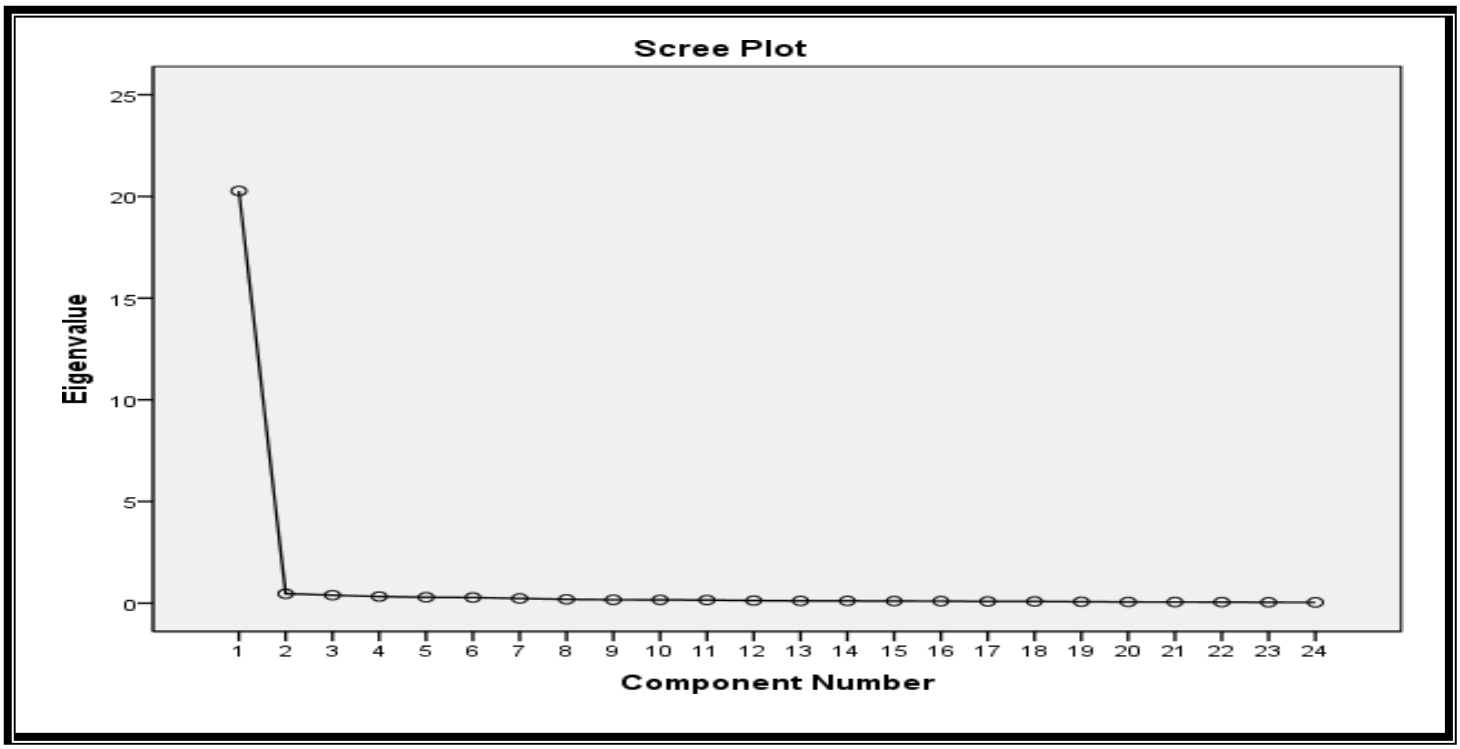

Figure 2.6 Scree Plot of the Corporate Social Responsibility

Exploratory Factor Analysis of the Purchase Intention

How well-suited your data is for factor analysis can be determined by the Kaiser-Meyer- Olkin (KMO) test. Based on SPSS v.24 results, the KMO measure of sampling adequacy at 0.791 indicates that factor analysis can be conducted on the data. Moreover, Bartlett's test of Sphericity was very large and significant at c2 = 1099.660, with a p < .000. Therefore, the data is more suited to factor analysis. The following Table 3.8 shows the results.

Table 4.7

Kaiser-Meyer-Olkin of the Purchase intention (n=188)

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.791
Bartlett's Test of Sphericity	Approx. Chi-Square	1099.660
	df	3

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.791
Bartlett's Test of Sphericity	Approx. Chi-Square	1099.660
	df	3
	Sig.	.000

In the context of the Varimax rotation method, the outputs of Table 3.9 display that all 3 items were known as accurate tools to measure of purchase intention.

Table 4.8

Exploratory Factor Loadings of the Purchase Intention (n=188)

Item	**Component**
	1
PI1	.888
PI2	.891
PI3	.891

Further, the Scree plot (see Fig. 2.7) indicates that the factor loading for this variable as the curve started to flatten after the individual factor. Thus, all these factors statistically confirmed that the loading of corporate social responsibility items was very suitable for the current research.

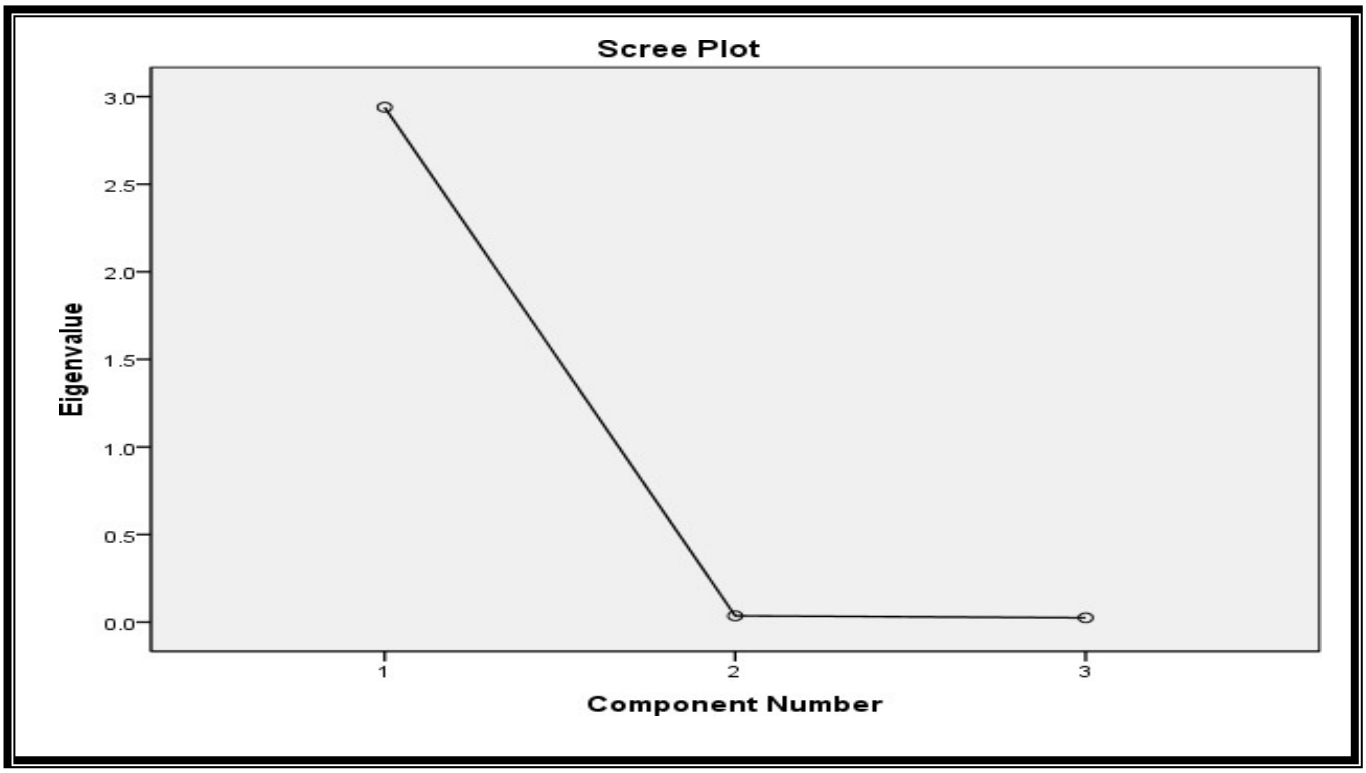

Figure 2.7 Scree Plot of the Purchase Intention

RELIABILITY OF THE MEASUREMENT INSTRUMENT

The Cronbach Alpha test is used to test the reliability of the research instrument. The 13 items of the four dimensions (perceived quality, brand awareness, brand loyalty, and brand association) are run for reliability test. The reliability coefficients (Cronbach Alpha) are within the agreed upon lower limit of 0.7 (Sekaran & Bougie, 2016). The Cronbach Alpha of 0.828 (as shown in Table 4.10) suggests that the items are reliable and internally consistent to represent the brand equity. Table 3.10 summarizes the values of alpha for all variables in this research which are well above the 0.70 value using SPSS v24.

Table 4.9

Reliability Test Results of the Measurement Instrument (n=188)

Variable	Dimension	Cronbach's alpha Value ≥ .70
Corporate Social Responsibility	Economic	.870
	Legal	.873
	Ethical	.875
	Philanthropic	.893
Purchase Intention	----------	.890

As shown in Table 4.10, the results obtained in this study indicate the instrument has a very high level of validity as well as reliability.

Descriptive analysis

The descriptive statistics of the variables through mean and standard deviation can give the researcher a detailed idea of how the participants in the survey have responded to the items in the questionnaire. The descriptive statistics using SPSS v24 of each variable can be seen as follow:

Descriptive Statistics of the Economic

As evidenced in Table 4.11 summary of mean and standard deviation for economics. The frequency distribution for the 7 items shows the mean (3.657) and standard deviation (1.287). The results show that the means on all items were high (greater than 3). As a result, the sample data is meaningful for achieving the current research's objectives.

Table 4.10

Descriptive Statistics of the Economic (n=188)

Item	Mean	Std. Deviation
EC1	3.692	1.250
EC2	3.745	1.295
EC3	3.734	1.318

EC4	3.707	1.442
EC5	3.468	1.135
EC6	3.654	1.229
EC7	3.601	1.339
Average	**3.657**	**1.287**

Descriptive Statistics of the Legal

As evidenced in Table 3.12 summary of mean and standard deviation for legal. The frequency distribution for the 7 items shows with a mean (3.655) and standard deviation (1.392). The results show that the means on all items were high (greater than 3). As a result, the sample data is meaningful for achieving the current research's objectives.

Table 4.11

Descriptive Statistics of the Legal (n=188)

Item	Mean	Std. Deviation
L1	3.681	1.389
L2	3.606	1.423
L3	3.628	1.376
L4	3.537	1.330
L5	3.718	1.333
L6	3.734	1.419
L7	3.681	1.471
Average	**3.655**	**1.392**

Descriptive Statistics of the Ethical

As evidenced in Table 4.13 summary of the mean and standard deviation for ethical. The frequency distribution for the 5 items shows the mean (3.644) and standard deviation (1.398). The results show that the means on all items were high (greater than 3). As a result, the sample data is meaningful for achieving the current research's objectives

Table 4.12

Descriptive Statistics of the Ethical (n=188)

Item	Mean	Std. Deviation
ET1	3.644	1.461
ET2	3.580	1.414
ET3	3.601	1.347
ET4	3.713	1.400
ET5	3.681	1.370
Average	**3.644**	**1.398**

Descriptive Statistics of the Philanthropic

As evidenced in Table 4.14 summary of the mean and standard deviation for philanthropic. The frequency distribution for the 5 items shows with a mean (3.719) and standard deviation (1.453). The results show that the means on all items were high (greater than 3). As a result, the sample data is meaningful for achieving the current research's objectives.

Table 4.13

Descriptive Statistics of the Philanthropic (n=188)

Item	Mean	Std. Deviation
P1	3.750	1.378
P2	3.665	1.444
P3	3.697	1.480
P4	3.771	1.490
P5	3.713	1.471
Average	**3.719**	**1.453**

Descriptive Statistics of the Purchase intention

As evidenced in Table 4.15 summary of mean and standard deviation for purchase intention. The frequency distribution for the 3 items shows the mean (3.716) and standard deviation (1.488). The results show that the means on all items were high (greater than 3). As a result, the sample data is meaningful for achieving the current research's objectives

Table 4.14

Descriptive Statistics of the Purchase Intention (n=188)

Item	Mean	Std. Deviation

PI2	3.702	1.494
PI3	3.729	1.497
Average	**3.716**	**1.488**

Hypotheses testing

Hypotheses testing using correlation analysis

In this research, the correlation between variables has been examined between the independent variables using Pearson correlation as shown in Table 3.16.

Table 4.15

Pearson Correlations for Independent Variable and Dependent Variable

		CSR	EC	L	ET	P	PI
CSR	Pearson Correlation	1	.879**	.885**	.877**	.887**	.842**
	Sig. (2-tailed)		.000	.000	.000	.000	.000

	N	188	188	188	188	188	188

The researchers intend to analyze whether there is a positive and significant relationship between corporate social responsibility and purchase intention. The correlation hypotheses are as shown below.

H1: There is a positive and significant correlation between corporate social responsibility and purchase intention.

H1a: There is a positive and significant correlation between economic and purchase intention.

H1b: There is a positive and significant correlation between legal and purchase intention.

H1c: There is a positive and significant correlation between ethics and purchase intention.

H1d: There is a positive and significant correlation between philanthropy and purchase intention.

Table 4.16 shows that indicate that there is a positive and significant relationship between corporate social responsibility and purchase intention with a correlation of (0.84) use (H1). In addition, there is a positive and significant relationship between economic and purchase intention with a correlation of (0.81) use (H1a). Moreover, it can be seen in Table 3.16 that legal is positively and significantly correlated with purchase intention with a correlation of (0.83) use (H1b). While the results show that there is a positive and significant relationship between ethics and purchase intention with a correlation of (0.80) uses (H1c). Finally, the results show that there is a positive and significant relationship between philanthropy and purchase intention with a correlation of (0.84) use (H1d). Then, all the correlation hypotheses were accepted.

HYPOTHESES TESTING USING REGRESSION ANALYSIS

Regression analysis is also undertaken in this research to infer the relationship between an independent variable and dependent variables. The direct effect hypotheses are as shown below.

H2: Corporate social responsibility has a positive and significant effect on purchase intention.

H2a: The economy has a positive and significant effect on purchase intention.

H2b: The law has a positive and significant effect on purchase intention.

H2c: The ethical factor has a positive and significant effect on purchase intention.

H2d: Philanthropy has a positive and significant effect on purchase intention.

The result in Table 3.17 shows a positive and significant effect of corporate social responsibility on purchase intention (t = 38.121, p >.0.05). The result suggests that purchase intention is expected to increase when corporate social responsibility has a beta value of equal to 1.096. Therefore, hypothesis (H2) is supported.

Table 4.16

Results of Linear Regression between Corporate social responsibility and Purchase Intention

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.304	.112		2.723	0.04
	CSR	1.096	.029	.842	38.121	.000
a. Dependent Variable: PI						

Moreover, the result in Table 4.18 shows a positive and significant effect of the economy on purchase intention (t = 30.386, p >0.05). The result suggests that purchase intention is expected to increase when the economy has a beta value equal to 1.132. Therefore, hypotheses (H2a) are supported.

Table 4.17

Results of Linear Regression between Economic and Purchase Intention

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.426-	.142		2.990	.003
	EC	1.132	.037	.813	30.586	.000
a. Dependent Variable: PI						

Furthermore, the result in Table 4.19 shows a positive and significant effect of legal on purchase intention ($t = 35.715$, $p > 0.05$). The result suggests that purchase intention is expected to increase when the legal has a beta value of equal to 1.066. Therefore, hypotheses (H2b) are supported

Table 4.18

Results of Linear Regression between Legal and Purchase Intention

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.180-	.116		1.558	.121
	L	1.066	.030	.834	35.715	.000
a. Dependent Variable: PI						

Additionally, the result in Table 4.20 shows a positive and significant effect of ethics on purchase intention ($t = 29.400$, $p > 0.05$). The result suggests that purchase intention is expected to increase when the ethical has a beta value of equal to 1.003. Therefore, hypotheses (H2c) are supported.

Table 4.19

Results of Linear Regression between Ethical and Purchase Intention

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.063	.132		.474	.636
	ET	1.003	.034	.807	29.400	.000
a. Dependent Variable: PI						

Finally, the result in Table 4.21shows a positive and significant effect of philanthropy on purchase intention (t = 38.483, p >0.05). The result suggests that purchase intention is expected to increase when the philanthropic has a beta value of equal to 1.006. Therefore, the hypothesis (H2d) is supported.

Table 4.20

Results of Linear Regression between Philanthropic and Purchase Intention

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.024	.104		.234	.815
	P	1.006	.026	.843	38.483	.000
a. Dependent Variable: PI						

Conclusions

The present research has reached a number of conclusions based on the data analysis results of the questionnaire form, which can be contested in the following:

1. Intellectual propositions emphasized that the sources of corporate social responsibility are extremely important to cover the nature life of the Garden city.
2. Corporate social responsibility can be viewed through four dimensions (economic, legal, ethical, and philanthropic).
3. There are multiple mechanisms for increasing obtaining purchase intentions that help to achieve the goals of the Halabja Group.
4. The Halabja Group's possession of the sources of corporate social responsibility makes them more vigilant, and able to understand and benefit from environmental data in building a way to manage their business and respond quickly to them.
5. The subject of purchase intentions was not the focus of the research of many writers and researchers, and there were very limited studies in different environments about the current research environment.
6. Corporate social responsibility helps organizations meet the economic, legal, ethical, and philanthropic demands of the business.
7. This research expects the ability of Halabja Group to achieve a high level of purchase intentions would depend on achieving corporate social responsibility.
8. Corporate social responsibility is considered the main factor influencing consumers' intention to purchase in the housing sector in the Garden city.
9. With high corporate social responsibility, the Halabja Group is able to increase the purchase intentions of customers.
10. The result of this research showed that Halabja Group should pay more attention to corporate social responsibility as it helps to be more successful.
11. According to the opinion of respondents, there are differences in levels between the dimensions of the independent variable and dependent variables.
12. The result shows the positive and significant effect of corporate social responsibility on purchase intentions.
13. The subject of corporate social responsibility is among the topics that are full of challenges facing the management of Halabja Group, which is the continuous change and

adaptation to new challenges, especially in light of the rapid developments in the environment.

14. The housing sector in the Garden city endeavor to be developed requires the possession of an economic, legal, ethical, and philanthropic in order to adapt and keep pace with rapid changes in the external environment.

Recommendations

Based on the conclusions of the present research, the researcher review the recommendations developed by the research in order to promote the positive aspects revealed by the research and develop the negative and weak aspects of the housing sector in the Garden city in the Kurdistan Region of Iraq, The following recommendations have been developed for:

1. The Halabja Group should seek to increase the level of corporate social responsibility by using the appropriate strategic direction towards achieving their goals and that is by setting short, medium, and long-term plans to achieve the goals.
2. The Halabja Group should seek to increase the protection of the environment.
3. In any case, the housing sector in the Garden city should communicate with the international housing sector in order to identify the modern methods that can be used to achieve corporate social responsibility.
4. The administrative structure of the housing sector should be updated to conform to managerial developments until routines and bureaucracy are reduced at work.
5. The Halabja Group should work in the housing sector based on the four main factors (economic, legal, ethical, and philanthropic) to be in a significant relationship with customers' trust.
6. The researcher recommends the leaders of the housing sector in the Garden city listen to and benefit from the views, ideas, proposals, and suggestions provided by the customers.

Implementation Mechanisms

After completing a detailed presentation of the research recommendations, the researcher goes towards setting a set of mechanisms that can help the housing sector in the Garden city in the Kurdistan Region of Iraq to implement the recommendations by the following:

1. Adopting work mechanisms that will enhance the practices of corporate social responsibility in the sector Garden city as a philosophy practiced with customers
2. Activating environmental monitoring and control mechanisms by focusing on establishing administrative units and preparing individuals trained to survey and monitor the environment, given their association with the strategic vision and desire to change in the housing sector in the Garden city in the Kurdistan Region of Iraq and thus their contribution to achieving these goals.
3. Adopting the managerial mechanisms that support the practice of corporate social responsibility in the housing sector in the Garden city.
4. The Halabja Group leaders need to pay more attention to customers' suggestions through continuous follow-up by a private employee for that, or through an administrative unit interested in learning about these suggestions and extracting ideas that conservation heights.
5. The Halabja Group should organize parties and recreational trips to enhance relations with customers and get closer to them and make them feel that they are one family and have one common destiny.
6. Increasing scientific research related to corporate social responsibility.

Future Studies

The present research proposes a set of research titles to be a field for future studies related to the variables of the current research as follows:

1. The effect of corporate social responsibility on customer orientation through purchase intentions (comparative research between various sectors in the Kurdistan region).
2. The role of marketing orientation in purchase intentions through corporate social responsibility.
3. The relationship between corporate social responsibility and purchase intentions and its effect on competitive advantage.
4. The effect of corporate social responsibility in purchase intentions: moderation role of Halabja Group strategy.
